1. SAFETY INFORMATION

Boiler installation shall be completed by qualified agency. See glossary for additional information.

⚠️ WARNING

Fire, explosion, asphyxiation and electrical shock hazard. Improper installation could result in death or serious injury. Read this manual and understand all requirements before beginning installation.

Become familiar with symbols identifying potential hazards.

⚠️ This is the safety alert symbol. Symbol alerts you to potential personal injury hazards. Obey all safety messages following this symbol to avoid possible injury or death.

⚠️ DANGER

Indicates a hazardous situation which, if not avoided, WILL result in death or serious injury.

⚠️ WARNING

Indicates a hazardous situation which, if not avoided, could result in death or serious injury.

⚠️ CAUTION

Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

⚠️ CAUTION

WHAT TO DO IF YOU SMELL GAS

• Do not try to light any appliance.
• Do not touch any electrical switch; do not use any phone in your building.
• Immediately call your gas supplier from a neighbor’s phone. Follow gas supplier’s instructions.
• If you cannot reach your gas supplier, call the fire department.

⚠️ WARNING

Do not tamper with or use this boiler for any purpose other than its intended use. Failure to follow these instructions could result in death or serious injury. Use only manufacturer recommended parts and accessories.

⚠️ CAUTION

Laceration, burn hazard. Metal edges and parts may have sharp edges and/or may be hot. Use appropriate personal protection equipment to include safety glasses and gloves when installing or servicing this boiler. Failure to follow these instructions could result in minor or moderate injury.

P/N 240011326, Rev. E [09/15/2017]
Check our website frequently for updates: www.ecrinternational.com

Information and specifications outlined in this manual in effect at the time of printing of this manual. ECR International reserves the right to discontinue, change specifications or system design at any time without notice and without incurring any obligation, whatsoever.
3. Component Listing - Refer to diagrams on following pages.

1. User Interface Displays information regarding boiler condition. Allows adjustment of boiler operating parameters. NOTE: Does not replace thermostat used to control central heating space.

2. Combustion Air Inlet (2"/3") See section 6.

4. Low Voltage Terminal Strip Connection of all low voltage wiring, including thermostat.

5. Igniter

6. Flame Sensor

7. Sight Glass permits observation of burner flame.

8. Burner (see page 43)

9. Heat Exchanger

10. Condensate Collector

11. Return Water Temperature Sensor

12. Drain Valve (see page 16)

13. Internal Primary Loop Ball Valve

15. Vent Temperature Sensor

17. Heat Exchanger Pump

18. Gas Shutoff Valve Fuel supply isolation during servicing. See section 7

19. Combustion Air Blower Delivers proper quantity of combustion air, receives fuel from gas valve, mixes air and fuel sending mixture to burner for combustion.

20. Gas (Control) Valve Delivers proper quantity of fuel to Combustion Air Blower. See section 7.

21. Supply Water Temperature Sensor and High Limit Switch

22. Low Water Cutoff Senses inadequate quantity of water. Turns off boiler before damage can occur.

23. Safety Relief Valve Factory supplied, Field installed. See section 5.

24. High Voltage Junction Box For connection of 120V components. See section 8.

27. Wall Hanging Support Bracket (see page 13) Integral to boiler. Allows wall mounting when used with supplied wall mounting bracket. See section 4.

28. Air Vent

29. Boiler Control Module

30. Transformer Supplies 24V power to low water cutoff.

31. Flue Air Mixture Pressure Test Port - Not available on all models.

32. Combustion Analysis Test Port

33. Internal Pump Relay - Not available on all models.

34. Heat Exchanger Surface Temperature Switch

35. ASME Plate

See Section 5 For Piping Instructions
4.1 Boiler Location Considerations

- Ambient room temperature always above 32°F (0°C) to prevent freezing of liquid condensate.

- Approved for installation in closets.

- Protect gas ignition system components from water (dripping, spraying, rain, etc.) during operation and service (circulator replacement, condensate trap, control replacement, etc.).

- Wall mount only.

- Access to outdoors to meet minimum and maximum pipe lengths for combustion air and vent piping. See section 6.

- Disposal of condensate. See section 6.

- Drainage of water (or water - antifreeze solution) during boiler service or from safety relief valve discharge. See section 5.

- Access to system water piping, gas supply, and electrical service. See sections 5, 7 and 8.

- Clearances to combustible materials and service clearances. See Table 2 and figure 4-1.

- Multiple Boilers can be wall mounted, placed side by side, or back to back.

(1) Required distances measured from boiler jacket.
(2) Service, proper operation clearance recommendation.
4.2 Pre-pipe supply and return water connections with factory fittings before wall mounting.

4.3 Wall Mounting
Mount boiler on wall using wall mounting bracket included with unit.

- Structure must be capable of supporting boiler weight plus 60 lbs (28 kg). See Table , page 4.

- Wall mount bracket has 4 slots allowing mounting on two (2) wall studs spaced at 11½" to 16½" on center. See figure 4-2.

- Boiler includes (4) 3/8" x 3" lag screws and (4) washers for attaching wall mount bracket to wood studs. Field source appropriate fasteners for other wall constructions (masonry, concrete).

- Attach wall mount bracket level on wall.

- Boiler must engage with wall mount bracket.

- Avoid overhang on sides of wall mount bracket. Verify boiler bracket is centered on wall bracket. See figure 4-2.

- When mounting boiler onto wall insert two plastic stoppers and two plastic plugs to packaging holes on back of boiler. See parts listed on page 2.

- Mount boiler vertically or slightly tilted backward to insure the low water cutoff functions properly. See figure 4-3 for low water cutoff orientation.

Note: Lift boiler using chassis. Using front jacket, vent piping, water or gas fittings to lift boiler may cause damage to the boiler.

Note: Use two (2) wrenches when tightening and fitting to pipe boiler's threaded fittings. Boiler's internal piping can be damaged if subjected to excessive torque.

**FIGURE 4-2  Wall Mount Bracket Engaged with Bracket on Boiler**

**WARNING**
Fire, explosion hazard. Mount boiler vertically or slightly tilted backward to insure proper function of low water cutoff. Failure to follow these instructions could result in death or serious injury.

**FIGURE 4-3  Low Water Cutoff Orientation**

Note: Lift boiler using chassis. Using front jacket, vent piping, water or gas fittings to lift boiler may cause damage to the boiler.

Note: Use two (2) wrenches when tightening and fitting to pipe boiler's threaded fittings. Boiler's internal piping can be damaged if subjected to excessive torque.
5 - HYDRONIC PIPING

5.1 General

- Install piping in accordance with authority having jurisdiction.
- Support system piping and safety relief valve discharge piping. Boiler's internal piping and wall mount bracket can be damaged if subjected to excessive weight.
- Size central heating pump (and domestic hot water pump, if used) for system requirements only. Internal heat exchanger pump compensates for pressure drop through boiler internal piping and heat exchanger.
- Thoroughly clean and flush system before connecting to boiler.
- If oil is present in system water, use approved detergent to wash system.
- Flush system to remove any solid objects such as metal chips, fibers, or Teflon tape, etc.

5.2 Special Conditions

- System piping exposed to freezing conditions: Use inhibited propylene glycol solutions certified by fluid manufacturer for use with closed water heating system. Do not use automotive or ethylene glycol.
- Boiler installed above radiation level (or as required by authority having jurisdiction). Integral low water cutoff provided in boiler. See pages 10 & 11.
- Boiler used in connection with refrigeration system. Install piping in parallel with boiler, with appropriate valves to prevent chilled medium from entering boiler.
- System piping connected to heating coils located in air handling unit exposed to refrigerated air circulation. Install flow control valves or other automatic means to prevent gravity circulation of boiler water during cooling cycle.

![FIGURE 5-1 Safety Relief Valve & Air Vent](Viewed from front of boiler)

**Note** Position Air Vent and Safety Relief Valve to provide space for discharge piping.

**WARNING**

- Poison hazard. Ethylene glycol is toxic. Do not use ethylene glycol.
- Never use automotive or standard glycol antifreeze, even ethylene glycol made for hydronic systems.
- Ethylene glycol can attack gaskets and seals used in hydronic systems.
- Use only inhibited propylene glycol solutions certified by fluid manufacturer as acceptable for use with closed water heating system.
- Thoroughly clean and flush any system that used glycol before installing new Boiler.
- Provide user with Material Safety Data Sheet (MSDS) on fluid used.
WARNING
Burn and scald hazard. Safety relief valve could discharge steam or hot water during operation. Install discharge piping per these instructions.

5.3 Safety Relief Valve and Air Vent

- Install safety relief valve and air vent using pipe fittings provided with boiler. See figure 5-1.
- Install safety relief valve with spindle in vertical position.
- Do not install shutoff valve between boiler and safety relief valve.
- Install discharge piping from safety relief valve. See figure 5-2.
- Use ¾” or larger pipe.
- Use pipe suitable for temperatures of 375°F (191°C) or greater.
- Individual boiler discharge piping shall be independent of other discharge piping.
- Size and arrange discharge piping to avoid reducing safety relief valve relieving capacity below minimum relief valve capacity stated on rating plate.
- Run pipe as short and straight as possible to location protecting user from scalding and properly drain piping.
- Install union, if used, close to safety relief valve outlet.
- Install elbow(s), if used, close to safety relief valve outlet and downstream of union (if used).
- Terminate pipe with plain end (not threaded).
5.4 Trim Piping

- Temperature - Pressure Gauge. Install temperature pressure gauge using nipple, tee and bushing provided with boiler. See figure 5-3.

- Drain Valve. Install drain valve using nipple, tee and bushing provided with boiler. See figure 5-3.

5.5 System Piping

- See Table 3 for basic system piping configurations.

- Systems with automatic fill valves require back flow prevention device.

- Single boiler system. See figures 5-5, 5-6, 5-7A, & B for general guidance. Additional considerations:
  - Boiler control is designed for single central heating pump. Installer responsible for integration of multiple central heating pumps.
  - Boiler control allows domestic hot water prioritization. Function could be lost if central heating pump not directly connected to control system.

- Multiple boiler system. See figure 5-8A, B & C for general guidance. Additional considerations:
  - Control system requires equivalent water temperatures entering each boiler to properly sequence and adjust system supply temperature.
  - Install multi boiler sensor kit. See "Parts, Kits & Optional Accessories" manual for part number.

- Heating system with existing primary loop, close internal primary loop ball valve.

- Heating system without existing primary loop, leave internal primary loop ball valve open to use internal primary loop.
Illustrations are meant to show system piping concept only. Installer responsible for all equipment and detailing required by authority having jurisdiction.

5 - HYDRONIC PIPING

5-8C Multiple Boilers Using Primary/Secondary Pumping with Open External Primary Loop
6.1 General

This boiler requires a dedicated direct vent system. Install combustion air and vent piping in accordance with these instructions, authority having jurisdiction, and:

Vent connections serving appliances vented by natural draft shall not be connected into any portion of mechanical draft systems operating under positive pressure.

Install vent system in accordance with these instructions.

6.2 Removal of Existing Boiler From Common Vent System

When existing boiler is removed from common venting system, common venting system is likely to be too large for proper venting of appliances remaining connected to it. After removal of existing boiler, following steps shall be followed with each appliance remaining connected to common venting system placed in operation, while other appliances remaining connected to common venting system are not in operation:

- Seal any unused openings in common venting system.

- Visually inspect venting system for proper size and horizontal pitch. Determine there is no blockage or restrictions, leakage, corrosion and other deficiencies which could cause an unsafe condition.

- When practical, close all building doors, windows, and all doors between space in which appliances remaining connected to common venting system are located and other spaces of building. Turn on clothes dryer and any appliance not connected to common venting system. Turn on exhaust fans, such as range hoods and bathroom exhaust so they will operate at maximum speed. Do not operate summer exhaust fan. Close fireplace dampers.

- Turn on appliance being inspected. Follow lighting instructions. Adjust thermostat so appliances will operate continuously.

- Test for spillage at draft hood relief opening after 5 minutes of main burner operation. Use flame of match or candle, smoke from cigarette, cigar or pipe.

- Determine each appliance remaining connected to common venting system properly vents when tested as outlined above. Then return doors, windows, exhaust fans and any other gas-burning appliance to their previous condition of use.

- Any improper operation of common venting system should be corrected so installation conforms with National Fuel Code, ANSI Z223.1/NFPA 54 and/or Natural Gas and Propane Installation Code, CAN/CSA B149.1. When re-sizing any portion of common venting system, common venting system should be re-sized to approach minimum size as determined using appropriate tables in Chapter 13 of the National Fuel Gas Code, ANSI Z223.1/NFPA 54 and/or Natural Gas and Propane Installation Code, CAN/CSA B149.1.

6.3 Venting Materials

</tbody>
</table>

- IPEX is approved vent manufacturer in Canada listed to ULC-S636.
- IPEX System 636 Cements and Primers are approved in Canada listed to ULC-S636.

Use of cellular core PVC (ASTM F891), cellular core CPVC, or Radel® (Polyphenolsulfone) in venting systems shall be prohibited.

**WARNING**

Use of cellular core PVC for venting flue gas could result in death, or serious injury.

**WARNING**

Covering non-metallic vent pipe and fittings with thermal insulation shall be prohibited.
6.4 Vent Pipe Installation

- Minimum and maximum combustion air and vent pipe lengths listed in Table 5. Pipe length counted from combustion air connector to termination.

- Install field-sourced 2" to 3", or 3" to 4" transitions, if used, in vertical section.

- 90° elbows equivalent to 5.0 ft (1.6 m). 45° elbows equivalent to 3.5 ft (1.1 m). 2° to 3", or 3" to 4" transitions have no equivalent length. See Table 6.

- Use flexible Polypropylene piping (PP) in a vertical position only. Check PP pipe manufacturer for details. Each foot of PP flexible pipe is equivalent to 2½ feet of smooth pipe of same diameter.

- Slope vent pipes minimum 1/4” per foot (21 mm/m) back toward boiler. Support horizontal sections to prevent sags capable of accumulating condensate.

- Support piping in accordance with pipe manufacturer’s instruction and authority having jurisdiction. In absence of manufacturer’s instruction use pipe hooks, pipe straps, brackets, or hangers of adequate and strength located at intervals of 4 ft (1.2m) or less. Allow for expansion/contraction of pipe.

- Combustion air and vent piping must be air tight and water tight.

- Certified vent system components must NOT be interchanged with other vent systems or unlisted pipe/fittings.

6.5 Vent Termination

- Terminate combustion air and vent pipes with fittings or concentric vent kit.
  A. See "Parts, Kits and Optional Accessories" manual for concentric vent kit part numbers.
  B. Use horizontal pipe for vent and 90° elbow for combustion air termination when using fittings.

- Separate vent terminal from air inlet terminal to prevent flue gas recirculation. If T-Terminal is used on flue pipe at sidewall, air inlet terminal shall be at least 36° or more away from vent terminal.

- Locate combustion air termination as far as possible from swimming pool, swimming pool pump house, and other sources of airborne chlorine.

- Locate combustion air and vent terminals as required by authority having jurisdiction.

---

Note: Use of vent covers may cause freezing. If using vent covers overall vent length must be considered. Failure to heed this information may compromise operation of this boiler.
6 - COMBUSTION AIR AND VENT PIPING

**FIGURE 6-1** Two Pipe Roof Vent

- 12” (205mm) Min. Separation or greater separation is manufacturer recommended.
- 12” (205mm) or Greater Separation Between Bottom Of Combustion Air Intake and Bottom Of Vent.

**FIGURE 6-2** Two Pipe Side Wall Vent

- 3” (76mm) Min. 24” (610mm) Max. Separation.
- 12” (305mm) Min. Separation Between Bottom Of Combustion Air Intake and Bottom Of Vent.

**FIGURE 6-3** Two Pipe Side Wall Vent (Multiple Appliances)

- 12” (305mm) Min. Separation.
- Manuf. Recommends Greater Separation.

### Roof Terminations

- 12” (205mm) Min. horizontal separation between combustion air intake and vent of same appliance.
- 12” (205mm) Min. 84” (2134mm) Max. vertical separation between combustion air intake and vent of different appliances.
- 15” (381mm) Max. horizontal length of vent.
- Min. vent/intake between different appliances 12” (305mm).
- Max. allowable total vertical vent length with outside exposure is 10 ft. (3.05m).
- Abandoned unused masonry chimney may be used as chaseway for combustion air and vent. Both combustion air and vent pipe must exit above top of chimney with clearances as shown in figure 6-1.

### Side Wall Terminations

- 3” (76mm) Min. 24” (610mm) Max. Separation horizontal separation between combustion air intake and vent terminations.
- 12” (305mm) Min. vertical separation between combustion air intake and vent terminations.
- 12” (305mm) min. 24” (610mm) Max. separation between bottom of combustion air intake and bottom of vent.
- Multiple terminations as shown in 6-1, and 6-3 must be a min. of 12” (305mm) horizontally between vent of one termination and air intake of next appliance. Manufacturer recommends greater separation.
- Max. allowable total outside exposure vent length equals 10 ft. (3.05m).
- Maintain a pitch of 1/2” per ft. (42mm/m) outside exposure back to boiler to ensure proper condensate drainage for horizontal runs.
**FIGURE 6-4 Side Wall Concentric Terminal**

1" (25.4mm) Max.

Combustion Air

Vent

**FIGURE 6-5 Side Wall Concentric Terminal Multiple Appliances**

1" (25mm) Max.

Combustion Air

Vent

Roof Overhang

12" (305mm) Min.

36" (914mm) Min.

Maintain 12" (30cm) US (18" (46cm) Canada) Clearance Above Highest Anticipated Snow Level or Grade

24" (610mm) minimum Horizontal distance between end bells of each concentric terminal to prevent flue gas recirculation.

**FIGURE 6-6 Concentric Terminal Connection**

*2" (51mm), 3" (76mm) or 4" (102mm) Diameter Intake/combustion air

Combustion Air

Vent

OD 3½" (89mm) - *2" (51mm) kit
OD 4½" (114mm) - 3" (76mm) kit
4" (102mm) kit

** Note: Securing strap must be field installed to prevent movement of termination kit in side wall

**2" (51mm) Diameter = 41" Length (1.1m)
3" (76mm) Diameter = 47" Length (1.2m)
4" (102mm) Diameter = 36" Length (0.9m)

** Overall length may be modified by cutting or extending both combustion air and vent pipes. 12" (305mm) is minimum allowable length and 60" (1.2m) is maximum allowable length for this dimension.

SDR-26 PVC (D2241) only may be used for extending pipes. Do not use Schedule 40 PVC or use couplings to extend pipes. Dimension will change if intake/vent pipes are lengthened or shortened.

** Note

* 2" (51mm) For use with models 050/075/100
3" (77mm) For use with models 075/100/150/200/299
4" (101mm) For use with model 299

** See Note Below

* See Note Below
Concentric Vent Roof Terminations

- Glue inner vent pipe to prevent recirculation.
- Maintain 12" (305mm) US (18"(457mm) Canada) minimum clearance above highest anticipated snow level. Maximum of 24"(610mm) above roof.
- Support must be field installed to secure termination kit to structure.
- Elbow, roof boot/flashing field supplied.
- Allowed Wall/Roof thickness 1/2"-30" (12.7mm - 762mm).
- Vertical concentric vent system can be installed in unused masonry chimney.

Grade, Snow & Ice

Maintain 12"(305mm) US (18"(457mm) Canada) clearance above highest anticipated snow level 24" (610mm) above roof or ground. Avoid locations where snow may drift and block vent and combustion air. Ice or snow may cause boiler to shut down if vent or combustion air becomes obstructed.

Doors & Windows

Combustion air and vent termination must be 12" (305mm) from or below doors, windows or gravity inlet.

* See Tables 4 & 5  Combustion air and Vent Piping Length Page 24.
6 - COMBUSTION AIR AND VENT PIPING

**FIGURE 6-10  Flue on Sidewall, Combustion Air on Roof**

Maintain 12" (305mm) US (18" (457mm) Canada) clearance above highest anticipated snow line 24" (610mm) above roof.

**FIGURE 6-11  Flue on Sidewall, Inside Combustion Air**

Maintain 12" (305mm) US (18" (457mm) Canada) clearance above highest anticipated snow line.

**FIGURE 6-12  Two Pipe Side Wall with 45° Vent**

- Vent 45° Elbow Upward
- 12" (305mm) Min. 24" (610mm) Max. Separation

**FIGURE 6-13  Side Wall Concentric Terminal w/ Accelerator**

- 1" (25.4mm) Max. Separation
- Combustion Air
- Vent w/Accelerator

**FIGURE 6-14  Side Wall Venting Terminal w/T-Terminal**

12" (305mm) Min. Separation of Combustion Air and Vent shall be maintained. No maximum separation is required when using T-Terminal for vent.

**Note**

Configurations of single pipe vent with flue on the sidewall, requires a tee as the vent terminal. See figures 6-10 and 6-11.

If separation in Fig. 6-2 or Fig 6-12 is not large enough to prevent cross flow contamination between flue gas and fresh air use T-Terminal as shown in Fig. 6-14. Use of T-Terminal for vent as shown in Fig. 6-14 does not have a maximum separation requirement between flue gas and fresh air.
6.7 Side Venting Terminal Requirements of:

<table>
<thead>
<tr>
<th>Venting terminal from doors and windows</th>
<th>See figure 6-15</th>
</tr>
</thead>
<tbody>
<tr>
<td>Venting terminal from forced air inlet of other appliances</td>
<td>See figure 6-16</td>
</tr>
<tr>
<td>Venting terminal from snow level</td>
<td>See figure 6-17</td>
</tr>
<tr>
<td>Venting terminal from vegetation</td>
<td>See figure 6-18</td>
</tr>
<tr>
<td>Venting terminal from public walkway</td>
<td>See figure 6-19</td>
</tr>
</tbody>
</table>

Termination must be min. 12" (305mm) from or below doors, windows or gravity inlet. If boiler uses inside air min. 4' (1219 mm).

**Doors & Windows**
Combustion air and vent termination must be min. 12" (305mm) from or below doors, windows or gravity inlet. If boiler uses inside air min. 4' (1219 mm).

**Condensate**
Vent gas may condense, forming moisture, may be corrosive. Protect building materials at vent from exhaust of vent gas.

**Forced Air Inlet**
Terminate venting system minimum 3' (914mm) above and 10' (3.0m) from any forced air inlet (except boiler’s combustion air inlet).

**Grade, Snow & Ice**
Maintain 12"(305mm) US, 18"(457mm) Canada clearance above highest anticipated snow level, 24" (610mm) above roof.
Avoid locations where snow may drift and block vent and combustion air. Ice or snow may cause boiler to shut down if vent or combustion air becomes obstructed.

**"L" Corner**
Vent termination shall NOT be installed closer than 3' (914mm ) from inside corner of “L” shaped structure.
**Multiple Family Dwellings**

Vent shall not terminate directly above paved sidewalk or paved driveway located between two single-family dwellings serving both dwellings.

**Vegetation, Plants & Shrubs**

Keep vent termination 3’ minimum (914mm) away from vegetation. Position termination where vent vapors will not damage plants/shrubs or air conditioning equipment.

**Meters, Regulators, deck, porch**

Vent termination US only - 4’ (1.2m), Canada - 6’ (1.9m) horizontally from, no case above or below, electric meters, gas meters, regulators, and relief equipment, or under deck or porch.

**Walkways**

Locate vent termination minimum 7’ (2.1m) above any public walkway, with consideration to condensate.

**People or Pets**

Locate combustion air and vent termination to prevent accidental contact with people or pets.

**Stones, Balls, Etc.**

Position combustion air and vent termination where it will NOT be damaged by foreign objects, such as stones, balls, etc.

**Vapors**

Position termination where vent vapors are not objectionable.

**Eddy, Flue Gases**

Position termination so it will not be effected by wind eddy, air born leaves, snow, or recirculated vent gases. Give consideration to excessive wind and locate away from windward side of building.
6.8 Multiple Boiler Venting Installation

- Multiple boiler application boiler can vent individually or use common vent pipes.

- If boilers vent individually follow guidelines as described in figures 6-1 through 6-7.

- If boilers vent through common vent pipes, as shown in Figure 6-17, choose common vent pipe per Table 8. Choose size from Table 9 for pipes between boiler and common vent pipes.

- Longest individual vent lengths and common vent length together must be shorter than 100 ft. (30m).

  \[ H + L \leq 100 \text{ ft (30m)} \] (See Table 9)

- Each boiler must have flow check valve to prevent flue gas back flow.

- External terminals follow same rule as single boiler venting as described in Section 6.6 and 6.7

- Locate combustion air and vent terminals as required by authority having jurisdiction.

- Flow check valve and vent pipe shall be made by the same manufacturer for proper compatibility. Check common vent kit for more information on flow check valve.

### Table 8 - Minimum Diameter for Individual Boiler in Common Venting System

### Table 9 - Common Venting Pipe Diameters

- Minimum 12” (305mm) U.S.; 18” (457mm) Canada Above Anticipated Snow Line

---

**FIGURE 6-17** Mulitple Boilers With Common Venting Pipe
6.9 Condensate Piping

- Use materials acceptable to authority having jurisdiction. In absence of such authority:
  - USA - PVC or CPVC per ASTM D1785/D2845 Cement or primer per ASME D2564 or F493.
  - Canada - CSA or ULC certified PVC/CPVC pipe, fittings and cement.
- Attach PVC tee provided with boiler and field sourced piping to condensate drain at bottom of boiler. See figure 6-18.
- Slope condensate drain pipe minimum 1/4" per foot (21mm/m) away from boiler.
- Use field source condensate pump if boiler located below disposal point.
- Field source condensate neutralizing kit as required by authority having jurisdiction or for environmentally friendly condensate disposal.

**FIGURE 6-18 Condensate Drain** (150-299 MBH shown)

- Do not glue cap on if used for dust protection. End must be left open.
- Condensate Tee (field installed) on condensate drain pipe
- Do not place in environment with temperatures below freezing. Condensate outlet will block if condensate freezes.
### 7.1 General

- Use piping materials and joining methods acceptable to authority having jurisdiction. In absence of such requirements:
  - USA - National Fuel Gas Code, ANSI Z223.1/NFPA 54
  - Size and install gas piping system to provide sufficient gas supply to meet maximum input at not less than minimum supply pressure. See Table 10.
  - Support piping with hooks, straps, bands, brackets, hangers, or building structure components to prevent or dampen excessive vibrations and prevent strain on gas connection. Boiler will not support piping weight.
  - Use thread (joint) compound (pipe dope) suitable for liquefied petroleum gas.
  - Provide sediment trap upstream of gas valve.
  - Install manual main shutoff valve outside of jacket. See figure 7-2.

### 7.2 Conversion Kit Instructions

- See Gas Conversion Kit Instructions included with Boiler.

### Table 10 - Gas Supply Pressure

</tbody>
</table>

**Note:** See Glossary - Piping Table 16
7.3 Leak Check Gas Piping

Pressure test boiler and gas connection before placing boiler in operation.

- Pressure test over 1/2 psig (3.5 kPa). Disconnect boiler and its individual gas shutoff valve from gas supply system.

- Pressure test at 1/2 psig (3.5 kPa) or less. Isolate boiler from gas supply system by closing manual gas shutoff valve. See figure 7-2.

- Locate leakage using gas detector, noncorrosive detection fluid, or other leak detection method acceptable to authority having jurisdiction. Do not use matches, candles, open flames, or other methods that can provide ignition source.

- Correct leaks immediately and retest.

DANGER
Fire Hazard. Do not use matches, candles, open flames, or other methods providing ignition source. Failure to comply will result in death or serious injury.

FIGURE 7-2 Manual Main Gas Shutoff Valve Outside Boiler Jacket

FIGURE 7-3 Gas Shutoff Valve - 050/075/100/150/200

FIGURE 7-4 Gas Shutoff Valve - 299
8.1 General
Electrically bond boiler to ground in accordance with requirements of authority having jurisdiction. Refer to:
- USA- National Electrical Code, ANSI/NFPA 70.

8.2 Electric Knockouts (figure 8-1)
- Five knockouts located on bottom of chassis.
  A. Three knockouts located under junction box are reserved for high voltage wires. Choose connectors using total diameter of wire bundles.
  B. Two knockouts located to right of high voltage knockouts (outside of junction box) are reserved for low voltage wiring. Use supplied grommets when using these knockouts.

8.3 Line Voltage Connections (figure 8-2)
- Boiler
  A. Provide individual 120V, 15 amp circuit (recommended) with fused disconnect or service switch as required by authority having jurisdiction.
  B. Open High Voltage Junction Box (see figures 3-4 and 3-5) to access line voltage terminal strip.
  C. Connect 120 VAC circuit to line voltage terminal strip 120 VAC L,N,G.
- Central Heating Pump, if used.
  A. Isolate pump from control module if pump FLA (Full Load Amps) exceeds maximum allowable current draw. See Figure 8-3 and Table 11.
  B. Connect pump to line voltage terminal strip CH PUMP L,N,G.
- Domestic Hot Water Pump, if used.
  A. Isolate pump from control module if pump FLA exceeds maximum allowable current draw. See Figure 8-3 and Table 11.
  B. Connect pump to line voltage terminal strip DHW PUMP L,N,G.

8.4 External Connections (figure 8-4)
- User Interface Terminals
  A. Factory wired to USER INTERFACE terminals
  B. Optional - Remote mount user interface for improved access. Use low voltage knockout.
  C. Maximum wire length is 100 ft (30m) for 22 ga. wire, or 150 ft (45m) for 18 ga. wire.
- Argus Link (Multiple boiler applications only)

---

**WARNING**

Electrical shock hazard. Turn OFF electrical power supply at service panel before making electrical connections. Failure to do so could result in death or serious injury.

**Note**

Wiring diagrams can be found in Section 14 of this Manual.

---

**FIGURE 8-1 Electric Knockouts Bottom Of Boiler**

</tr>
</tbody>
</table>

If CH or DHW pump current is more than the maximum allowable current draw install proper field sourced relays as shown in figure 8-3.
• **Outdoor Sensor, if used.**
  
  A. Provided with boiler.
  
  B. Locate outdoor sensor to protect against wind and direct sunlight. Mounting instructions provided with sensor.
  
  C. Maximum wire length is 100 ft (30m) for 22 ga. wire, or 150 ft (45m) for 18 ga. wire.
  
  D. Connect wires to OUTDOOR SENSOR terminals. Wires are interchangeable.

• **System Sensor (Multiple boiler applications only)**

• **Domestic Hot Water (DHW) Thermostat, if used.**

  A. Use temperature control with dry contacts rated at 0.5 amps @ 120 VAC. Boiler control does not provide power to DHW temperature control.

  **Note** IMPORTANT: Do not apply power to DHW T-T terminals. Dry contact only, use of isolation relay may be necessary.

  B. Maximum wire length is 330 ft (100m) 22 gauge wire.

  C. Connect wires (interchangeable) to DHW T-T terminals. Wires are interchangeable.

• **Central Heating Thermostat**

  A. Use thermostat or boiler system control with dry contacts related 0.5 amps @ 120 VAC. Boiler control does not provide 24 VAC power to central heating thermostat.

  B. Locate and install thermostat per manufacturer's instructions. Maximum wire length is 330 ft (100m) for 22 ga. wire.

  C. Connect wires to CH T-T terminals. Wires are interchangeable.

  Use dry contact for wires to CH T-T terminal and DHW T-T terminal. E33 error code is displayed if voltage is sent back to the control board. If error is not corrected for extended period of time, this voltage can permanently damage control board.
9.1 Fill Boiler With Water And Purge Air

To maintain boiler efficiency and prevent boiling inside the heat exchanger, flush entire heating system until clean.

- Flush heating system, including all heating zones.
- Fill boiler with potable water.
- Fill boiler and system piping with water (or antifreeze-water solution, if used). See antifreeze information page 14. Purge air from boiler using air vent. Purge air from system piping.
- Close air vent after all air is purged from both boiler and system piping.
- Inspect system piping and boiler connections. Repair any leaks immediately.
- Activate all heating zones and calls for heat, including CH calls and DHW calls (if available).
- Close manual gas shut off valve. Let system run for 30 minutes. When boiler goes into lockout, reset boiler by pressing "Reset" button until boiler resets.
- Do not open gas shutoff valve until all air is purged from system.

9.2 Fill Condensate Trap with Water

- Disconnect spring tension clip from condensate hose barb. See figure 9-1.
- Disconnect tubing below from hose barb.
- Pour approximately 2 cups (473 ml) of water into condensate drain.
- Reconnect tubing to hose barb with spring tension clip. See figure 9-1.
### 9 - START UP PROCEDURE

**Boiler is factory programmed with following factory default settings, Table 12.** Parameters can be adjusted to suit particular application using the User Interface. See figure 9-2.

</table>

* List parameters in event of Control Module Failure to reprogram your settings.
9.4 **Boiler Start-up and Operational Test**

1. Verify air is purged from hydronic piping.
2. System test pumps - verify each pump is operational using vibration, noise and amp draw.
3. Verify gas piping
   - Confirm pressure test. See section 7.3.
   - Visually inspect piping to determine there are no open fittings or ends, and all valves at unused outlets are closed and plugged/capped.
   - Purge air from piping. Confirm there is a steady gas supply to the boiler.
   - Check piping and connections for leaks immediately after gas is turned on. Shut off gas supply and make necessary repairs if leaks found.
4. Follow OPERATING INSTRUCTIONS to initiate boiler operation. See section 10.
5. Inspect combustion air and vent piping. Verify pipe is not leaking and terminations are unobstructed and vent gas discharge is not a nuisance or hazard.
6. Verify boiler functions.
7. Inspect condensate disposal system. Verify condensate flows adequately and is disposed properly.
8. Check control module operation.
9. Check field sourced limits, low water cutoffs, etc. per manufacturer's instructions.

9.5 **Check Firing Rate**

1. Measure input, if a gas meter is installed in the system.
   - Turn off gas to all other appliances.
   - Activate some heating zones to dissipate heat.
   - Set boiler on high fire.
   - Use ½, 1 or 2 cu ft dial on gas meter. Measure time required for two or more complete revolutions. Measure time for one or more minutes.
   - Calculate input.

   **For Natural Gas:**

   
   \[
   \text{Input (MBH)} = \frac{3600 \times \text{cu ft}}{\text{seconds}}
   \]

   Example: Natural Gas - Gas flow from

   Meter = 2 cu ft

   Measured time = 72 seconds

   \[
   \text{Input Rate (MBH)} = \frac{3600 \times 2 \text{ cu ft}}{72 \text{ seconds}} = 100 \text{ MBH}
   \]

   **For Propane (LP):**

   \[
   \text{Input (MBH)} = \frac{9160 \times \text{cu ft}}{\text{seconds}}
   \]

   For Metric formulas- See Glossary

2. Compare measured input to Table 13. If calculated input is not in range given in Table 13, check firing rate again after setting the combustion following steps in section 9.6.

9.6 **Combustion Adjustment**

Calibrated Combustion Analyzer is necessary for the following combustion adjustment.

- **Note** Before setting combustion in HIGH fire, activate all heating zones to dump heat generated by the boiler running on high fire.

1. Enter installer menu (Enter + Menu buttons for 4 seconds).
   - A. Scroll down to System Test.
   - B. Push Enter button to enter System Test. When “System Test Off” displays, push Enter button and “Off” will start flashing.
   - C. Scroll up to High Power and push Enter. “High Power” will stop flashing and becomes solid.
   - D. Unit is now locked in high fire.
2. Perform combustion test on HIGH fire using calibrated combustion analyzer. Adjust CO₂ to within specifications by rotating the Throttle Screw, counterclockwise to increase CO₂ level, clockwise to decrease CO₂ level. See Figures 9-3, and 9-4. After adjusting CO₂ to correct level, verify:
(1) CO PPM level is in specified range and
(2) flame signal is in specified range.
See Appendix A page 78.
CO₂ level, CO PPM level, and flame signal for HIGH fire are given in the following tables.

<table>
<thead>
<tr>
<th>Gas</th>
<th>CO₂</th>
<th>CO</th>
<th>Flame signal</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Min</td>
<td>Max</td>
<td>Design Target</td>
</tr>
<tr>
<td>Natural Gas</td>
<td>9.0%</td>
<td>9.3%</td>
<td>9.3%</td>
</tr>
<tr>
<td>Propane</td>
<td>10.0%</td>
<td>11.0</td>
<td>10.5%</td>
</tr>
</tbody>
</table>

Adjust Offset Screw slowly and in small steps, no more than 1/8 of a turn each time. See Figures 9-5 and 9-6.

Perform combustion test on LOW fire using calibrated combustion analyzer. Adjust CO₂ to within specifications by turning Offset Screw, clockwise to increase CO₂ level, counterclockwise to decrease CO₂ level. After adjusting CO₂ to correct level, verify:
(1) CO PPM level is in specified range and
(2) flame signal is in specified range.
CO₂ level, CO PPM level, and flame signal for LOW fire are given in the following tables.

<table>
<thead>
<tr>
<th>Gas</th>
<th>CO₂</th>
<th>CO</th>
<th>Flame signal</th>

<tr>
<td>Propane</td>
<td>10.0%</td>
<td>11.0</td>
<td>11.0%</td>
</tr>
</tbody>
</table>

WARNING
Fire, explosion, asphyxiation and electrical shock hazard. Read this instruction and understand all requirements, including requirements of authority having jurisdiction before making adjustments. Failure to follow these instructions could result in death or serious injury.

Note
P/N 240011326, Rev. E [09/15/2017]
4. See Figures 9-5 and 9-6 for location of Offset Screw on modulating gas valve of various boiler models. T40 male Torx bit is necessary for removal of Offset Screw cap and adjustment of Offset Screw.

5. Set boiler to High Power using System Test to confirm combustion in High Fire (Step 2).

6. Combustion setting is now complete.
   A. Exit System Test mode by pushing Enter. High Power will start flashing.
   B. Scroll down to "OFF". Push Enter button "OFF" stops flashing.
   C. Push Menu button twice to escape Installer Manual. Boiler returns to CH mode or DHW mode depending on type of call for heat available.

7. Check ignition quality 4 times with front jacket off. Close internal manual gas valve for 5 seconds and then re-open it. Boiler will go through post purge – prepurge – ignition sequence. Reset boiler if boiler goes into lockout.

8. Check ignition quality 4 times with the front jacket on. Close the external gas shutoff valve for 5 seconds and re-open it. Boiler will go through a post purge – prepurge – ignition sequence. Reset the boiler if boiler goes into lockout.
9 - START UP PROCEDURE

9.7 Perform CSD-1 Compliance Test (see paragraph 2.2 page 7)

Verify operation of boiler safety control operation with regard to no flow conditions as follows:

1. Turn off boiler using boiler service switch.

2. Disable primary boiler pump. Disconnect multi pin connector J7 from control module. See figure 9-10.

3. Disable secondary system pumps attached to system.

5. Boiler will fire. Based on natural convection within boiler, boiler will either:

   OR

   B. Shut off burner E40 "Return Water Temp". This is a soft lockout. When water temperature drops below limit boiler will automatically refire then Lockout A-06 requiring manual reset of control module. Press Reset button on User Interface.

   OR

   C. Shut off burner E39 "Flue Temperature Sensor". This is a soft lockout. When flue sensor drops below limit, boiler will automatically refire then Lockout A-06 requiring manual reset of control module. Press Reset button on User Interface.

6. After safety operation is verified, turn off boiler via service switch. Remove jumper in T-T. Replace J7 connector into control module, enable secondary pump operation, turn service switch on and restart system to verify operation.

WARNING

Asphyxiation hazard. Carbon monoxide is odorless, tasteless, clear colorless gas, which is highly toxic. Verify cap is firmly placed on combustion analyzer port to prevent CO emission. Failure to do so could result in death or serious injury.

FIGURE 9-7 Combustion Analyzer Port - 050/075/100/150/200 MBH

FIGURE 9-8 Combustion Analyzer Port - 299 MBH

FIGURE 9-9 Burner Flame

Look for BLUE flame with slight YELLOW tips evenly spaced around burner.
9.8 Complete Start Up Procedure

1. Reset control parameters to operating settings if adjusted to allow startup and operation test.

2. Follow instructions TO TURN OFF GAS TO APPLIANCE (page 45) if boiler is not being placed into immediate operation.

3. Enter installer information on Warranty Registration Card.

4. Gather all instructions, manuals, wiring diagrams, warranty registration card and other supporting information. Review with user and/or affix in conspicuous location adjacent to boiler.
**WARNING**

If you do not follow these instructions exactly, a fire or explosion may result causing property damage, personal injury or loss of life.

- This appliance is equipped with an ignition device which automatically lights burner. **Do NOT try to light this burner by hand.**

- Before operating smell all around appliance area for gas. Be sure to smell next to floor because some gas is heavier than air and will settle to the floor.

- **Use only your hand to turn the gas shutoff valve.** Never use tools. If valve will not turn by hand, do not try to repair it, call a qualified service technician. Force or attempted repair may result in fire or explosion.

- **Do not use this appliance if any part has been under water.** Immediately call a qualified service technician to inspect appliance and to replace any part of control system and any gas control which has been under water.

---

10.1 **OPERATING INSTRUCTIONS**

*Stop! Read Safety information above.*

- Set thermostat to lowest setting.

- Turn "OFF" all electrical power to appliance.

- This appliance is equipped with an ignition device which automatically lights the burner. **Do not try to light burner by hand!**

- Remove upper jacket panel.

- Turn gas shutoff valve clockwise (↻) to closed position. Handle should be perpendicular to gas pipe.

- Wait 5 minutes for any gas to clear. Smell for gas, including near floor. If you smell gas, **STOP!** Follow instructions on this page: "**What To Do If You Smell Gas.**" If you do **not** smell gas, go to next step.

- Turn gas shutoff valve counter clockwise (↺) to the open position. Handle should be parallel to gas pipe.

- Replace upper jacket panel.

- Turn "ON" electrical power to appliance.

- Set thermostat to desired setting.

- If the appliance will not operate, follow instructions TO TURN OFF GAS TO APPLIANCE and call your service technician or gas supplier.

---

10.2 TO TURN OFF GAS TO APPLIANCE

- Set thermostat to lowest setting.

- Turn "OFF" all electric power to appliance if service is to be performed.

- Remove front jacket panel.

- Turn gas shutoff valve handle clockwise (↻) to closed position. Handle should be perpendicular to gas pipe.

- Replace front jacket panel.

---

**CAUTION**

**WHAT TO DO IF YOU SMELL GAS**

- Do not try to light any appliance.

- Do not touch any electrical switch; do not use any phone in your building.

- Immediately call your gas supplier from a neighbor’s phone. Follow the gas supplier’s instructions.

- If you cannot reach your gas supplier, call the fire department.

---

**FOR YOUR SAFETY READ BEFORE OPERATING**
11.1 Beginning of Each Heating Season

- Check boiler area is free from combustible materials, gasoline, and other flammable vapors and liquids.

- Visually inspect combustion air and vent piping for proper operation. Check for and remove any obstruction to flow of combustion air or vent gases. Immediately repair or replace pipe showing deterioration or leakage. Reassemble per instructions in section 6. Ensure proper reassembly and resealing of system.

- Visually inspect condensate drain line for proper operation. Checking for deteriorated or plugged condensate drain line. Verify condensate trap drains freely.

- Test safety relief valve for proper operation. Refer to valve manufacturer’s instructions packaged with relief valve.

- Examine flue passages in heat exchanger, burner, condensate lines, and cleaning (if necessary) by following instructions in “Annual Examination and Cleaning of Boiler Components” in this section.
11.2 Annual Shut Down Procedure

- Follow instructions “To Turn Off Gas To Appliance” unless boiler is also used to supply domestic hot water. See section 10.
- Drain system completely if system does not have antifreeze when heating system is to remain out of service during freezing weather.
- Drain condensate lines when boiler is to be exposed to freezing temperatures.

**WARNING**

Following service procedures must be performed by qualified service agent. Boiler owner shall not attempt these steps. Failure to do so could result in death or serious injury.

11.3 Annual Inspection and Cleaning of Boiler Components

- Obtain Burner Inspection Kit. Follow kit instructions to prepare for examination and cleaning.
- Burner and heat exchanger inspection and cleaning:
  1. Remove gasket and burner. Allow burner to clear top lip of chassis.
  2. Remove any residual sleeve and/or gasket material from removed burner.
  3. Clean burner using air hose directed into top of burner opening to dislodge any debris in burner ports. Inspect burner for foreign matter in flame ports or inside burner. Remove foreign matter by blowing with compressed air or vacuuming. Replace burner if it cannot be cleaned or is showing deterioration.
  4. Clean heat exchanger with low pressure water spray. Use flexible handle nylon brush to loosen sediment and oxide on all accessible heating surfaces of heat exchanger. Take care not to get brush stuck in heat exchanger.
  5. Remove any remaining loosened sediment using shop vacuum with snorkel attachment.
- Clean condensate collector if significant debris found in heat exchanger.
  1. Expand upper spring tension clip of condensate trap using hose clamp pliers. Disconnect condensate trap from condensate collector. See figure 9-1.
  2. Disconnect wire harness from vent temperature sensor. See figures 3-4 & 3-5.
  3. Loosen upper hose clamp securing condensate collector to flue pipe using 3/8" socket with 6" extension.

• Circulator pump and combustion air blower motor furnished with boiler are permanently lubricated from factory and require no further lubrication. Lubricate field sourced pumps and/or motors according to pump and/or motor manufacturer’s instruction.

• Check following components are operating properly and are free of blockages or obstructions:
  - air vent;
  - check venturi air inlet for blockage and clean as required;
  - verify pressure test port cap and combustion test port are in place;
  - return temperature sensor clip must be securely seated on pipe; Check boiler for any sign of leaks.
• Check low water cutoff using user interface.
  - Check operation by pressing test button on low water cutoff.
    - "Low Water" LED should illuminate and burner should shut down.
    - Should get error message on User Interface (E36).
  - Every 5 years remove low water cutoff. Reinstall after cleaning.
  - Every 10 years replace low water cutoff.
• See Table 13 page 40 for flame signal rate at 100% firing rate (High fire).
• Visual inspection of flame through sight glass. Burner should be fully illuminated. See figures 11-1 & 11-2.
• Check heating system expansion tank.
4. Remove ¼-20 hex flange nuts securing condensate collector to heat exchanger using 7/16" deep well socket. See figures 3-5 & 3-6.

5. Remove condensate collector assembly from heat exchanger and flue pipe.

6. Flush collector and condensate trap with water.

- Follow Burner Inspection Kit instructions to reassemble boiler and resume operation.
### 12.1 Ratings and Capacities

- Constructed and hydrostatically tested for maximum allowable working pressure of 150 psig (pounds per square inch gauge) (345 kPa) in accordance with ASME Boiler and Pressure Vessel Code, Section IV, Rules for Construction of Heating Boilers.
- Ratings use for elevations up to 2000 ft (600m) above sea level. (Table 14)
- For elevations between 2000 ft (600m) and 4500 ft (1350m), install high altitude control kit
- For elevations above 4500 ft (1350m) install high altitude control kit and:
  - USA - Reduce input rate 4% for each 1000 ft (300m) beyond 4500 ft.

<sup>(1)</sup> 1000 Btu/hr (British Thermal Units Per Hour)

<sup>(2)</sup> Heating Capacity and AFUE (Annual Fuel Utilization Efficiency) are based on DOE (Department of Energy) test procedures.

<sup>(3)</sup> Net AHRI Ratings based on piping and pickup allowance of 1.15. Contact Technical Support before selecting boiler for installations having unusual piping and pickup requirements, such as intermittent system operation, extensive piping systems, etc.
Is there power to the Boiler

NO

YES

Is User Interface Lit?

NO

YES

Turn ON Power to Boiler. Is User Interface Lit?

YES

NO

Check 120 Vac on Molex Connector on top of Lower Jacket is 120 Vac available?

YES

NO

Replace Main Wire Harness.

Check for 120 Vac Inside High Voltage Terminal Box. Is 120 Vac available?

YES

NO

Check Circuit Breaker or Emergency Disconnect Switch and 120 Vac Wiring to Boiler. Fix or Repair External Wiring.

Locate fuse holder on front of control and pull to check fuse. Spare fuse located on controller. Make sure all wire harness plugs are properly pushed in. Release plug lock with finger, remove and reconnect all 7 plugs. Check wiring from User Interface to Low Voltage Terminal Strip including checking continuity of the wires. Does User Interface Display work?

NO

YES

Remove User Interface from base. Using Digital Voltmeter check for 25 to 30 Vdc. Is voltage present?

NO

YES

Lockout Alarm A01
Ignit error

Is this a new boiler on first startup?
YES NO

Is this boiler to run with propane gas?

Has gas valve been adjusted per instructions?
NO YES

Enter the Installer Menu and place the boiler into test mode in high fire. Once the boiler starts, go to the boiler status screen and monitor the flame signal. Is the flame signal greater than 7.0uA when running on high fire?
YES NO

Does the boiler ignite and stay running?
YES NO

Reset the boiler by pressing the 'Reset' button. When the boiler tries to ignite, is there a strong, consistent spark evident through the sight glass?
YES NO

Remove the flame sensor and igniter and inspect. Is there any indication of damage or debris baked on?
YES NO

Replace/clean flame sensor or igniter

Replace Control Module

Replace Burner

Refer to the Heat Exchanger cleaning section

Disconnect the gas valve electrical harness and close the gas shutoff valve. With the ignition lead connected to the igniter, hold the tip near the chassis ground and attempt ignition. Is a spark observed between the igniter and ground?

Remove the gas train including the flue transition. Remove the burner and inspect. Any sign of damage to burner surface?

Inspect Vent System for blockages. Is the vent system clear?

Check vent termination for proper consideration of wind effects

Check all wires including the igniter and flame sensor leads. Check for proper and tight connections to control board. Are all wires connected?
YES NO

Connect all wires and check for secure fit

Inspect the flue way along the sides of the baffle near the coil for blockages. Is there any apparent debris or obstruction of the flue way?
YES NO

Refer to the Gas Valve Troubleshooting Tree
Error shows when safety circuit is open. Remove J13 connector from control module. Check for continuity between two pins connected to two pink wires, is continuity available?

Replace Control Module

Unplug molex connector on supply temperature sensor. Check continuity between two pins on sensor (two pins connected to two pink wires). Is continuity available?

Is boiler supply pipe (above heat exchanger) hot?

Let all zones run until water temperature drops.

Wait for boiler to cool down.

Is Heat Exchanger surface hot?

Check high limit and surface temperature switches

Replace Broken Switch

Boiler fired without enough water flow through heat exchanger. Heat exchanger is over heated. Either high limit or heat exchanger temperature switch is open.

Check the following:
• Air in system?
• Verify water flow in system piping
• Flush system if water is dirty.

Replace Wire Harness

Fix Loose Connections
Lockout Alarm A08
Fan error

Is Combustion Air Blower operating?

- YES
- NO

Disconnect 4-wire harness from Combustion Air Blower. Does Combustion Air Blower speed increase?

- YES
- NO

Replace Combustion Air Blower

Are 3-wire and 4-wire harnesses connected to Combustion Air Blower?

- YES
- NO

Disconnect harness from Control Module J9 connector. Measure voltage between two pins, J9-2 and J9-3 on Control Module (second and third pins of J9, count from outside). Is voltage 120 Vac +/- 10% available?

- YES
- NO

Replace Control Module

Replace harness

Disconnect 3-wire harness from Combustion Air Blower. Measure continuity in each wire. Continuity in each wire?

- YES
- NO

Replace Combustion Air Blower

Replace harness
13 - TROUBLESHOOTING

Disconnect harness from High Temperature Supply Switch and Control Module J13. Check continuity of both purple wires. Continuity available for both purple wires?

Is supply water temperature less than 185°F (91°C)?

<table>

Replace wire(s)
**Lockout Alarm A24**
3 flame failures

- **Inspect burner through sight glass. Is flame present?**
  - **NO**
    - **Clean or replace Flame Sensor**
  - **YES**
    - **Inspect harness connection. Is connection clean and secure?**
      - **NO**
        - **Replace Flame Sensor or harness**
      - **YES**
        - **Remove Flame Sensor. Is rod free of contamination?**
          - **NO**
            - **Replace Control Module**
          - **YES**
            - **Follow Operating Instructions to initiate boiler operation. Enter Installer Menu, Boiler Status, Flame Signal. Is flame signal greater than 3.7µA (Boiler may be running at any firing rate)?**
              - **YES**
                - **Replace Control Module**
              - **NO**
                - **Replace Flame Sensor and Burner**

Follow operating instructions to turn off gas to appliance. Replace gas valve.
Check Low Water Cutoff. Is amber lamp lit?

YES → Connect harness to Transformer. 
NO → Check Low Water Cutoff. Is Green Power Lamp lit?

YES → Is harness plugged into Control Module J16? 
NO → Replace Low Water Cutoff

YES → YES → Replace Low Water Cutoff 
NO → Replace Harness

NO → Disconnect harness from Low Water Cutoff and Control Module J16. Check continuity if harness. Harness OK?

YES → Replace Harness 
NO → Replace Low Water Cutoff

DisCONNECT Blue/Yellow harness from Transformer. Using digital meter check for 24 Vac. Is 24 to 30 Vac present?

YES → YES → Replace Low Water Cutoff 
NO → Replace Harness

NO → Disconnect Black/White Harness from Transformer. Is 120 Vac measured at Harness?

YES → Replace Main Harness 
NO → Replace Transformer
Read flue gas temperature on User Interface. Is temperature higher than 200°F?

**YES**
Boiler is over fired. Wait for boiler to cool. Fix flow rate problem if any, purging all air out of the system.

**NO**
Use thermal couple to measure flue gas temperature through sampling port. Is the measured temperature and flue temperature reading on User Interface significantly different?

**YES**
Replace Flue Gas Sensor

**NO**
Replace Control Module
**Blocking Error E 4 0**

Return Temp

Is correct harness connected to return sensor (2 Brown Wires)?

**YES**

Remove all liquid from connector. Check for leaks. Repair all leaks.

**NO**

Correct wiring

---

Unplug molex connector on return sensor. Is there moisture or liquid on metal pins? Liquid might be water or antifreeze solution.

**YES**

Is Heat Exchanger Pump properly oriented? (Pump arrow pointing down?)

**NO**

Install Heat Exchanger Pump in proper orientation

---

**YES**

Replace Control Module

**NO**

Replace Return Water Sensor

---

**P Blocking Error E 4 4**

Phase error

Measure incoming power with volt meter. Is terminal 120 VAC (L) approximately 120 VAC? Is 120 VAC (N) approximately 0 VAC?

**YES**

Correct power supply to Boiler

**NO**

---

**YES**

Replace Control Module

**NO**

Replace Wire Harness

---

Verify order of pins on J2. Pin order should be: empty, black (or red), white, green. Measure volts on pins of black wire and white wire. Is wiring/pins in right order? Does black/wire have 120 VAC? Does white wire/pin have 0 VAC? Is correct harness connected to return sensor (2 Brown Wires)?
These error messages are displayed when the control board detects fault in blower motor system. Check wire connector to blower. Check connector J9 on control board. Is any connection loose?

14.1 Connection Diagram - 050/075/100 MBH

EXTERNAL PUMP RELAY - LIMIT OF 1 AMP PER PUMP
SEE SECTION 8
14.2 Schematic Diagram of Ladder Form - 050/075/100 MBH
• **ANSI** - American National Standards Institute, Inc. oversees creation and maintenance of voluntary consensus standards, including ANSI Z21.13/CSA 4.9: Gas-Fired Low Pressure Steam and Hot Water Boilers.

• **ASTM** - American Society for Testing and Materials. ASTM International is one of largest voluntary standards development organizations in world trusted source for technical standards for materials, products, systems, and services. Known for their high technical quality and market relevancy, ASTM International standards have important role in information infrastructure that guides design, manufacturing and trade in the global economy.

• **AUTHORITY HAVING JURISDICTION** - Individual or organization adopting and enforcing codes, rules, and by-laws governing various concerns of community. Commonly referred to as "final authority" for any matters relating to LIFE SAFETY and BUILDING CONSTRUCTION within a community.

• **Btu** - Abbreviation for British Thermal Unit. Quantity of heat required to raise temperature of 1 pound of water 1°F.

• **BURNER** - Device for final conveyance of gas or mixture of gas and air, to combustion zone.

• **COMBUSTION** - Rapid oxidation of fuel gases accompanied by production of heat or heat and light. Complete combustion of fuel is possible only in presence of adequate supply of Oxygen.

• **COMBUSTIBLE MATERIAL** - Materials made of or surfaced with wood, compressed paper, plant fibers, or other materials capable of being ignited and burned. Such material shall be considered combustible even though flame-proofed, fire-retardant treated, or plastered.

• **CONDENSATE** - Liquid separated from flue gas due to reduction in temperature.

• **DIRECT VENT BOILER** - Boiler constructed and installed so all combustion air is derived directly from outdoors and all vent gases are discharged to outdoors.

• **DRAFT** - Pressure difference causes gases or air to flow through a chimney, vent, flue or appliance.

• **FLA** - Full load amps.

• **FLUE GASES** - Products of combustion plus excess air in appliance flues or heat exchanger.

• **HIGH-VOLTAGE** - Circuit involving potential of not more than 600 volts and having circuit characteristics in excess of those of low-voltage circuit.

• **IGNITER** - Device utilizing electrical energy to ignite gas at main burner.

• **LEAK CHECK** - Operation performed on gas piping system to verify system does not leak.

• **LOW WATER CUTOFF** - Device constructed to automatically cut off fuel supply when surface of water in boiler falls to lowest safe water level.

• **LOW-VOLTAGE** - Circuit involving potential of not more than 30 volts.

• **METRIC GAS METERS**

  **Natural Gas**

  \[
  \text{MBH} = \frac{127,116 \times \text{cu meters}}{\text{Seconds}}
  \]

  For example: Gas Meter measures 0.1 cubic Meters in 100 seconds

  \[
  \text{MBH} = \frac{127,116 \times 0.1}{100} = 127 \text{ MBH}
  \]

  **Propane Gas (LP)**

  \[
  \text{MBH} = \frac{383,482 \times \text{cu meters}}{\text{Seconds}}
  \]

• **PRESSURE TEST** - Operation performed to verify gas tight integrity of gas piping following its installation or modification.
• **PURGE** - To free gas conduit of air or gas, or mixture of gas and air.

• **PURGE TIME** - Period of time intended to allow for dissipation of any unburned gas or residual products of combustion.

• **QUALIFIED AGENCY** - Any individual, firm, corporation, or company engaged in and responsible for:
  - Installation, testing, or replacement of gas piping, or connection, installation, testing, repair or servicing of appliances and equipment.
  - Experienced in such work.
  - Familiar with all precautions required.
  - Complies with all requirements of authority having jurisdiction.

• **SAFETY RELIEF VALVE** - Valve designed to relieve pressure in hot water supply system when pressure exceeds pressure capability of equipment.

• **SAFETY SHUTOFF DEVICE** - Device that will shut off gas supply to controlled burner in event source of ignition fails.

• **SEDIMENT TRAP** - Gas piping arrangement designed to collect any liquid or solid contaminant before reaching gas valve.

• **VENT** - Passageway used to convey flue gases from appliance vent connector to outdoors.

• **VENTING SYSTEM** - Continuous open passageway from of appliance vent connector to outdoors for purpose of removing flue or vent gases.
1.1 Introduction
Boiler is equipped with programmable electronic control and user interface module.

1.2 Operation
- Display: 4 x 20 character LCD screen to show boiler status.
- Function Keys

<table>
<thead>
<tr>

<td>Scroll down to next menu item, Decrease value</td>
</tr>
</tbody>
</table>

1.3 Status Indication
The following status screens can be displayed:

- **Boiler Status Indicator**
  - F = Flame Detected
  - P = Central Heating System pump On
  - B = Combustion Air Blower On
  - S = Safety Relay Check
  - G = Gas Valve Open
  - D = DHW Pump On

- **Combustion Air Blower Speed Indicator**

- **Service Reminder Indicator**
  - Standby: No Demand 75°F

- **Boiler Supply Water Temperature Indicator**

- **Boiler Running in Central Heat mode**

- **Boiler Running in DHW mode**

- **Lockout Alarm Indicator**
  - Error code and short text description is displayed
  - Press ‘Reset’ key for manual reset.

- **Blocking Error**
  - Error code and short text description is displayed
  - Boiler automatically returns to Standby Mode when condition is eliminated.

</tr>
</tbody>
</table>

**Control module logs successful and failed ignition attempts. Information accessed in ‘Ignition Attempts’ Screen as shown.**

Ignition attempts are stored in non-volatile memory and are retained in event of power failure.

**Figure A-1 Typical Ignition Cycle**

Following control features are implemented to ensure safe and reliable operation of Combustion System:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>False Flame Detection</td>
<td>If flame is detected at end of pre-spark period (Ignit_0) than lockout will occur.</td>
</tr>
<tr>
<td>Re-ignition</td>
<td>If at end of safety period no flame detected control will go to post-purge removing unburned gas. Re-ignition attempt started following same cycle. Number of re-ignition attempts limited to 3 after which lockout occurs.</td>
</tr>
<tr>
<td>Intermittent Operation</td>
<td>Boiler can be firing continuously for 24 hours. Burner switched off and restart sequence follows.</td>
</tr>
<tr>
<td>Flame out too late</td>
<td>If flame detected after post purge lockout follows.</td>
</tr>
<tr>
<td>Safety relay test</td>
<td>In Safety ON/OFF state correct operation of safety relay is proved before ignition.</td>
</tr>
<tr>
<td>UL3563 High Limit Device</td>
<td>Boiler comes equipped with UL353 approved temperature high limit device. Gas Valve de-energized when supply temperature exceeds 203°F lockout follows.</td>
</tr>
</tbody>
</table>
### User Interface Display

<table>
<thead>
<tr>
<th>Boiler Status</th>

<td></td>
</tr>
<tr>
<td><strong>BOILER CONFIG</strong></td>
<td></td>
</tr>
<tr>
<td><strong>LOW WATER CUTOFF</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Disabled</strong></td>
<td></td>
</tr>
</tbody>
</table>

- **Address Selection” screen used to set boiler position in multiple boiler cascade installation. Refer to Multiple Boiler Installation Manual.**
- **Default setting of ‘0’ indicates boiler is operating in single boiler mode.**
- **Boiler incorporates integrated Low Water Cutoff device (LWCO) that disables boiler when low water condition exists. LWCO device located at high point of internal Heat Exchanger loop to detect low water condition.**
- **Detection of low water condition will result in blocking error; boiler will automatically resume normal operation when proper water level returns. Refer to Troubleshooting Guide.**
- **LWCO device can be disabled for diagnostic purposes or where applicable code permits.**
<table>
<thead>
<tr>
<th>User Interface Display</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Boiler Configuration</strong></td>
<td>Two pump modes are available:</td>
</tr>
<tr>
<td></td>
<td><strong>1. Pump Mode = 0 ‘CH or CH&amp;DHW’</strong></td>
</tr>
<tr>
<td></td>
<td>• In this mode either the CH or DHW pump terminal is energized depending on the type of demand (CH or DHW).</td>
</tr>
<tr>
<td></td>
<td>• CH and DHW pumps are never energized at the same time.</td>
</tr>
<tr>
<td></td>
<td>• In the case of a simultaneous call for both CH and DHW, the energized pump depends on whether the boiler is currently supplying the CH or DHW demand. Refer to DHW Priority settings below.</td>
</tr>
<tr>
<td></td>
<td>• This is typical of a hydronic system design with separate CH and DHW Pumps.</td>
</tr>
<tr>
<td></td>
<td><strong>2. Pump Mode = 4 ‘System Pump’</strong></td>
</tr>
<tr>
<td></td>
<td>• In this mode only one external system pump is installed in the hydronic system. This pump will energize independent of the type of demand (CH or DHW).</td>
</tr>
<tr>
<td></td>
<td>• Connect this pump to the CH/System Pump electrical terminal block. See page 56 for diagram.</td>
</tr>
<tr>
<td></td>
<td>• The DHW pump terminal does not function.</td>
</tr>
<tr>
<td></td>
<td>• This is typical of a hydronic system design which utilizes zone valves for all CH zones and an DHW indirect tank.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td>• Pump Mode selection depends on electrical and hydronic system design. Please refer to sections 5 and 8 for recommended hydronic piping and electrical configurations.</td>
</tr>
<tr>
<td></td>
<td>• Internal heat exchanger pump is energized anytime demand exists regardless of Pump Mode setting or type of demand (CH or DHW).</td>
</tr>
<tr>
<td></td>
<td><strong>‘Service Reminder’ feature allows the installer to enable or disable a service reminder notification on the User Interface at a predefined interval.</strong></td>
</tr>
<tr>
<td></td>
<td>Service reminder does not affect operation of boiler in any way. It is only a reminder to End User that routine preventative maintenance is required by qualified service technician.</td>
</tr>
<tr>
<td></td>
<td><strong>Allowed Range:</strong> 1 to 999 days</td>
</tr>

### CH Settings

<table>
<thead>
<tr>
<th>User Interface Display</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="CH Settings" /></td>
<td></td>
</tr>
</tbody>
</table>

**4. Central Heating (CH) modes available:**

- **CH Mode = 0 'CH with Thermostat’**
  - Boiler will attempt to satisfy CH demand while CH thermostat input is closed.
  - Boiler will modulate its firing rate to maintain CH set point and match system heat load.
  - CH set point adjusted in ‘Settings’ submenu under ‘User Menu’

- **CH Mode = 1 'CH with Thermostat and Outdoor Reset’**
  - Boiler will attempt to satisfy CH demand when CH thermostat input is closed.
  - Boiler will modulate its firing rate to maintain CH set point and match system heat load.
  - CH set point calculated as function of outdoor temperature using outdoor reset curve. See Figure A-2

- **CH Mode = 2 'CH with Full Outdoor Reset’**
  - CH demand is determined by outdoor temperature and Warm Weather Shutdown temperature.
  - Boiler will permanently attempt to satisfy CH demand, when CH demand is available.
  - CH thermostat input is ignored.
  - CH set point calculated as function of outdoor temperature using outdoor reset curve. See Figure A-2

- **CH Mode = 3 'CH with Permanent Demand’**
  - CH demand is permanently on.
  - Boiler will permanently attempt to satisfy CH demand.
  - CH thermostat input is ignored.
  - CH set point is adjusted in ‘Settings’ submenu under ‘User Menu’

**Note:**

- Once CH demand is satisfied (i.e. CH thermostat opens or boiler determines its minimum firing rate exceeds system heating load):
  - Burner shuts off, boiler enters post purge.
  - CH pump continues to run for 30 seconds.
  - Control will wait until Anti-cycle time of 180 seconds elapses before boiler fires again. Prevents short-cycling.

- The internal heat exchanger pump is energized anytime demand exists regardless of Pump Mode setting or type of demand (CH or DHW).
### CH Settings

<table>
<thead>
<tr>
<th>User Interface Display</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CH SETTINGS</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Warm Weather</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Shutdown Temp</strong></td>
<td></td>
</tr>
<tr>
<td><strong>70°F</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Allotted Range:</strong></td>
<td></td>
</tr>
<tr>
<td><strong>35°F to 100°F (2°C to 38°C)</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Default Setting:</strong></td>
<td></td>
</tr>
<tr>
<td><strong>70°F (21°C)</strong></td>
<td></td>
</tr>
</tbody>
</table>

If outdoor temperature is greater than Warm Weather Shutdown Temperature, demand for CH blocked and pumps stopped.

| **CH SETTINGS**        |             |
| **Reset Curve Design** |             |
| **Boiler**             |             |
| **180°F**              |             |
| **Outdoor**            |             |
| **70°F**               |             |

Allowed Boiler Range: **60°F to 195°F (40°C to 91°C)**
Default Boiler Setting: **180°F (82°C)**

Boiler capable of operating in Outdoor Reset Mode when included Outdoor Sensor is connected and proper CH Mode selected.

If CH Mode = 1, ‘Outdoor Temperature Reset with Thermostat’ or 2, ‘Full Outdoor Reset’ boiler will adjust CH set point proportional to outdoor temperature as defined by Outdoor Reset Curve below.

Outdoor reset curve adjusted by modifying Design and Mild Weather reference temperatures. See points A & B of Reset Curve below.

Calculated CH set point always limited between ‘Reset Curve Boiler Minimum/Maximum’ temperatures. See points C & D of Reset Curve below.

*Figure A-2 Outdoor Reset Curve*

Calculated supply temperature follows thick black line in graph below based on outdoor temperature.

**Note:**
- Modes only function when outdoor temperature sensor connected.
- If ‘Open’ outdoor sensor detected CH set point equal to ‘Boiler Reset Curve Design’ temperature.
- Outdoor temperature used for CH set point calculation measured once a minute and averaged with previous measurement to compensate for rapid outdoor temperature variations.

| **CH SETTINGS**        |             |
| **Reset Curve Mild Weath** |             |
| **Boiler**             |             |
| **100°F**              |             |
| **Outdoor**            |             |
| **70°F**               |             |

Allowed Boiler Range: 35°F to 120°F (2°C to 49°C)
Default Boiler Setting: 100°F (37°C)

Allowed Outdoor Range: 35°F to 85°F (2°C to 29°C)
Default Outdoor Setting: 70°F (21°C)

| **CH SETTINGS**        |             |
| **Reset Curve Min Max** |             |
| **Boiler Min**         |             |
| **60°F**               |             |
| **Boiler Max**         |             |
| **180°F**              |             |

Allowed Min. Range: 40°F to 180°F (4°C to 82°C)
Default Min. Setting: 70°F (21°C)

Allowed Max. Range: 80°F to 195°F (27°C to 91°C)
Default Max. Setting: 180°F (82°C)
### User Interface Display

<table>
<thead>
<tr>

### DHW Settings

<table>
<thead>
<tr>
<th>DHW SETTINGS</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Two DHW modes are available</strong></td>
<td></td>
</tr>
<tr>
<td>• <strong>DHW Mode = 0 'No DHW</strong></td>
<td></td>
</tr>
<tr>
<td>• DHW Mode is disabled</td>
<td></td>
</tr>
<tr>
<td>• The DHW thermostat input is ignored and the DHW pump is not used.</td>
<td></td>
</tr>
<tr>
<td>• <strong>DHW Mode = 2 'DHW Store with Thermostat'</strong></td>
<td></td>
</tr>
<tr>
<td>• Boiler reacts to DHW demand when DHW thermostat input closes.</td>
<td></td>
</tr>
<tr>
<td>• Boiler modulates to meet DHW demand similar to CH Mode except DHW set point is used. DHW set point set in Settings' submenu found in 'User Menu'.</td>
<td></td>
</tr>
<tr>
<td>• Simultaneous CH &amp; DHW demands handled using DHW Priority Timing. See 'DHW Maximum Priority Time' setting below.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:**
- Outdoor reset function disabled while operating in DHW Mode.
- Typical when using a DHW indirect storage tank.
- After DHW demand satisfied, boiler enters post purge mode and DHW pump continues to run for 15 seconds.
## User Interface Display

<table>
<thead>
<tr>
<th>DHW Settings</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DHW Settings</strong></td>
<td>Maximum time boiler operates in DHW mode limited by DHW Maximum Priority Time Setting. Priority timer starts when both CH and DHW demand is present. Boiler will switch from DHW back to CH operation after Maximum Priority Time has elapsed. CH demand then has priority until Maximum Priority Time has elapsed. Process repeats until either CH or DHW demand satisfied.</td>
</tr>
</tbody>
</table>
| **System Test** | System Test can be activated via installer menu for testing system at fixed power rates. Boiler can be started without CH or DHW demand being present. System Test has priority over any system demand while test mode activated. System Test mode automatically ends after 30 minutes boiler resumes normal operation. The following modes are available:  
  - Disabled  
  - Low power - Burner starts. After ignition period has finished the burner stays at low power  
  - Ignition power - Burner starts. Stays at ignition power  
  - High power - Burner starts. After ignition period has finished burner stays at high power.  
**Note:**  
- Before running System Test modes, check if hydronic system capable of dissipating heat.  
- Both heat exchanger and CH pumps are activated during System Test.  
- During System Test Mode, boiler will run at fixed power rates until supply water temperature is 93°C/195°F  
- All other safety functions remain active while in System Test Mode. |
| **Pump Test:** |  
- "Boiler Pump" is not used in this boiler.  
- When "CH/System Pump" is on, boiler internal pump and CH System pump are powered.  
- When "DHW Pump" is on, DHW pump and boiler internal pump are powered. |

IMPORTANT

In accordance with Section 325 (f) (3) of the Energy Policy and Conservation Act, this boiler is equipped with a feature that saves energy by reducing the boiler water temperature as the heating load decreases. This feature is equipped with an override which is provided primarily to permit the use of an external energy management system that serves the same function.

THIS OVERRIDE MUST NOT BE USED UNLESS AT LEAST ONE OF THE FOLLOWING CONDITIONS IS TRUE:

• An external energy management system is installed that reduces the boiler water temperature as the heating load decreases.
• This boiler is not used for any space heating
• This boiler is part of a modular or multiple boiler system having a total input of 300,000 BTU/hr or greater.
• This boiler is equipped with a tankless coil.
