When boiler is operating at maximum operating temperature, providing heating with all heat emitters operating, pressure gauge should not indicate more than 26.11 psi / 1.80 bar. If reading exceeds this figure larger expansion tank is required.
1. Safety Information

Boiler installation shall be completed by qualified agency. See glossary for additional information.

⚠️ WARNING

Fire, explosion, asphyxiation and electrical shock hazard. Improper installation could result in death or serious injury. Read this manual and understand all requirements before beginning installation.

⚠️ WARNING

Do not tamper with or use this boiler for any purpose other than its intended use. Failure to follow these instructions could result in death or serious injury. Use only manufacturer recommended parts and accessories.

⚠️ CAUTION

Laceration, burn hazard. Metal edges and parts may have sharp edges and/or may be hot. Use appropriate personal protection equipment to include safety glasses and gloves when installing or servicing this boiler. Failure to follow these instructions could result in minor or moderate injury.

Become familiar with symbols identifying potential hazards.

This is the safety alert symbol. Symbol alerts you to potential personal injury hazards. Obey all safety messages following this symbol to avoid possible injury or death.

⚠️ DANGER

Indicates a hazardous situation which, if not avoided, WILL result in death or serious injury.

⚠️ WARNING

Indicates a hazardous situation which, if not avoided, could result in death or serious injury.

⚠️ CAUTION

Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

NOTICE

Used to address practices not related to personal injury.

---

FOR YOUR SAFETY READ BEFORE OPERATING

⚠️ DANGER

Water Temperature Setting | 1st Degree Burn Exposure Time For An Adult | 2nd and 3rd Degree Burn Exposure Time For An Adult
---|---|---
120° F | 1 minute | 5 minutes
130° F | 5 seconds | 30 seconds
140° F | 2 seconds | 5 seconds
150° F | 1 second | 1.5 seconds
160° F | Instantaneous | 0.5 seconds

Note: Warning for Infants, Children, and Elderly: Great care must be taken when exposing the aforementioned groups to warm or hot water as they can be badly burned in exposure times less than half of the time for an adult.
2 - Introduction

2.1 Installation shall conform to requirements of authority having jurisdiction or in absence of such requirements:

**UNITED STATES**
- National Electrical Code, NFPA 70.

2.2 Where required by authority having jurisdiction, installation shall conform to Standard for Controls and Safety Devices for Automatically Fired Boilers, ANSI/ASME CSD-1. Additional manual reset low water cutoff may be required.

2.3 Requirements for Commonwealth of Massachusetts:
Boiler installation must conform to Commonwealth of Massachusetts code 248 CMR which includes but is not limited to:
- Installation by licensed plumber or gas fitter.

2.4 Manufacturer recommends use of Carbon Monoxide monitor may be requirement of local jurisdiction.

2.5 Designated Use
- DCC-150 and DCC-205 provide both central heating and domestic hot water.
- DCB-125 and DCB-165 central heating only.
- Indoor installation.
- Closet or alcove installation. Direct Vent Boiler does not require air vents when installed in closet or room.
- Direct vent boiler.
- For use with natural gas or liquefied petroleum gases (LP/propane).

2.6 The unit MUST NOT:
- Directly heat potable water. Indirect heating is acceptable.
- Heat water with non-hydronic heating system chemicals present (example, swimming pool water).
- Toxic chemicals, such as those used for boiler treatment, shall not be introduced into potable water used for space heating.
- Exceed 43 psig (2.96 bar) maximum allowable working pressure, or drop below minimum system pressure 7.25 psig (.50 bar)
- Exceed 176°F (80°C) system design temperature.

2.7 Operational Features
- Modulates to provide CH Turndown 5.5:1, DHW Turndown 7:1.
- Maximum output available for domestic hot water:
  - **DCC-150** - 136,000 btu/h (40 kW), capable of providing 3.5 (U.S.) gpm (13.2 liters/min) with a temperature rise of 70°F/39°C.
  - **DCC-205** - 180,000 btu/h (53 kW), capable of providing 5.0 (U.S.) gpm (18.9 litres/min) with temperature rise of 70°F/39°C.
- Integral Low Water Pressure Cutoff.
- Optional Outdoor Temperature Reset.
- Heat exchanger over heat protection.
- Boiler operating at maximum operating temperature, providing heat, pressure gauge should not indicate more than 26.11 psi / 1.80 bar. If reading exceeds this figure larger expansion tank is required.

Illustrations are a depiction of the boiler for general location of parts and may vary depending on model.
4.1 Boiler Location Considerations

- Ambient room temperature always above 32°F (0°C) to prevent freezing of liquid condensate.
- Approved for installation in closets or alcove provided it is correctly designed for that purpose and minimum clearances are met.
- Protect gas ignition system components from water (dripping, spraying, rain, etc.) during operation and service (circulator replacement, condensate trap, control replacement, etc.).
- Access to outdoors to meet minimum and maximum pipe lengths for combustion air and vent piping. See section 6.
- Disposal of condensate. See section 6.
- Drainage of water (or water - antifreeze solution) during boiler service or from safety relief valve discharge. See section 5.
- Access to system water piping, gas supply, and electrical service. See sections 5, 7 and 8.
- Clearances to combustible materials and service clearances. See Table 1 and Figures pg. 13.
- Boiler shall be installed on flat vertical wall which is capable of supporting the weight of the boiler.
- Room-sealed boiler installed in a room containing bath or shower shall be installed so person using bath or shower cannot touch any electrical switch or boiler control utilizing line voltage electricity.
- Multiple Boilers can be wall mounted, placed side by side, or back to back.
- Observe service clearances in all installations.
- For Direct Vent installations, air vents are not required in room boiler is installed in, or when installed in closet or compartment.

</tbody>
</table>

(1) Required distances measured from boiler jacket.
(2) Service, proper operation clearance recommendation.
* Allowance for piping at the bottom of boiler not included.

**WARNING**

Fire Hazard! Do not install on carpeting. Failure to follow these instructions could result in death or serious injury.

NOTE: Greater clearances for access should supersede fire protection clearances.

Minimum Clearance 17 ¾ in. [450 mm] From Front of Boiler

Combustible Clearances

0 in /0 mm between Back of Unit and wall

Front View of Boiler
4 - LOCATING BOILER

**CAUTION**

Boiler weight exceeds 140 pounds (63.5 kg). Do not lift boiler onto wall without assistance.

**Note**

Lift boiler using chassis. Do not use front jacket, vent piping, water or gas fittings to lift boiler as it may cause damage to the boiler.

**Note**

Use two (2) wrenches when tightening and fitting to pipe boiler’s threaded fittings. Boiler’s internal piping can be damaged if subjected to excessive torque.

4.2 Wall Mounting

1. Decide position of boiler on the wall allowing for all required clearances and flue terminal position.
2. Tape template to the wall. Ensure template is level and upright. Mark position of holes for boiler mounting bracket and plumbing connections.
3. Rear exit flue - mark position of hole for flue.
4. Side exit flue - mark horizontal center line of flue across the wall to side wall, then along side wall (ensure lines are parallel and sloped properly towards the boiler, refer to section 6. This will give position of center of hole for flue.
5. Cut hole in wall for coaxial flue. See sizing below:
   - 125 & 150 - 4 3/8" [110 mm] diameter
   - 165 & 205 - 5 5/16" [135 mm] diameter
6. Pre-pipe supply and return water connections with factory fittings before wall mounting.
7. Mount boiler on wall using wall mounting bracket included with unit.
8. Adjust the position of the boiler verify it is level.
5.1 General

- Primary/Secondary piping required.
- Install piping in accordance with authority having jurisdiction.
- Support system piping and safety relief valve discharge piping. Boiler's internal piping and wall mount bracket can be damaged if subjected to excessive weight.

**Notice**

The intended use of the internal heat exchanger pump is a boiler loop. Do not use as a primary system pump.

- Size central heating pump (and domestic hot water pump, if used) for system requirements only. Internal heat exchanger pump compensates for pressure drop through boiler internal piping and heat exchanger.
- Thoroughly clean and flush system before connecting to boiler.
- If oil is present in system water, use approved detergent to wash system.
- It is necessary to semi-annually check the water quality of central heating systems.
- Manufacturer recommends installation of magnetic dirt separator in the hydronic system where there are cast iron or steel components, or where the previous boiler was a cast iron heat exchanger. The abrasive, extremely fine sediment is difficult to remove and can deposit onto heat exchange surfaces and accumulate in pump cavities causing reduced efficiency and premature wear.
- Flush system until water runs clean and piping is free of sediment.
- Do not fill boiler or boiler system with softened water.
- Use only inhibited propylene glycol solutions certified by fluid manufacturer as acceptable for use with closed water heating system.
- Thoroughly clean and flush any system that used glycol before installing new Boiler.
- Provide user with Material Safety Data Sheet (MSDS) on fluid used.

**WARNING**

- Poison hazard. Ethylene glycol is toxic. Do not use ethylene glycol.
- Never use automotive or standard glycol antifreeze, even ethylene glycol made for hydronic systems.
- Ethylene glycol can attack gaskets and seals used in hydronic systems.
- Do not use petroleum based cleaning or sealing compounds boiler system.
- Do not fill boiler or boiler system with softened water.
- Use only inhibited propylene glycol solutions certified by fluid manufacturer as acceptable for use with closed water heating system.
- Thoroughly clean and flush any system that used glycol before installing new Boiler.
- Provide user with Material Safety Data Sheet (MSDS) on fluid used.

**WARNING**

Boiler and its individual shutoff valve shall be disconnected from gas supply piping system during any pressure testing of that system at test pressures in excess of 1/2 psi (3.40 kPa - 34.47 mbar). Boiler shall be isolated from the gas supply piping system by closing its individual manual shutoff valve during any pressure testing of gas supply piping system at test pressures equal to or less than 1/2 psi (3.5 kPa). Install boiler so that gas ignition system components are protected from water (dripping, spraying, rain, etc.) during appliance operation and service (circulator replacement, condensate trap, control replacement, etc.).
5.2 Special Conditions

Do not expose boiler and condensate piping to freezing temperatures.

- System piping exposed to freezing conditions: Use inhibited propylene glycol solutions certified by fluid manufacturer for use with closed water heating system. Do not use automotive or ethylene glycol.
- Boiler installed above radiation level (or as required by authority having jurisdiction). Integral low water pressure switch is provided in boiler.
- Boiler used in connection with refrigeration system. Install piping in parallel with boiler, with appropriate valves to prevent chilled medium from entering boiler.
- System piping connected to heating coils located in air handling unit exposed to refrigerated air circulation. Install flow control valves or other automatic means to prevent gravity circulation of boiler water during cooling cycle.

5.3 Safety Relief Valve and Air Vent

- Install safety relief valve using pipe fitting provided with boiler. See Figure 5-2.
- Install safety relief valve with spindle in vertical position.
- Do not install shutoff valve between boiler and safety relief valve.
- Install discharge piping from safety relief valve. Do not use plastic pipe.
- Use ¾” or larger pipe.
- Use pipe suitable for temperatures of 375°F (191°C) or greater. Do not use plastic pipe on safety relief valve.
- Individual boiler discharge piping shall be independent of other discharge piping.
- Size and arrange discharge piping to avoid reducing safety relief valve relieving capacity below minimum relief valve capacity stated on rating plate.
- Run pipe as short and straight as possible to location protecting user from scalding and properly drain piping.
- Install union, if used, close to safety relief valve outlet.
- Install elbow(s), if used, close to safety relief valve outlet and downstream of union (if used).
- Terminate pipe with plain end (not threaded).
5.4 Trim Piping
- Temperature - Pressure Gauge. Install temperature pressure gauge using piping provided with boiler. See Figure 5-1.
- Some boiler models may have integral drain valve located inside jacket directly underneath pump. Install provided external drain valve as required.

5.5 System Piping
- Ensure caps are removed from boiler water connections.
- See Figure 5-9 for basic system piping configurations.
- Systems with automatic fill valves require back flow prevention device.
- Single boiler system. See Figures 5-4, 5-5, for general guidance. Additional considerations:
  - Boiler control is designed for single central heating pump. Installer responsible for integration of multiple central heating pumps.
  - Boiler control allows domestic hot water prioritization. Function could be lost if central heating pump is not directly connected to control system.
- Multiple boiler system. Considerations:
  - Control system requires equivalent water temperatures entering each boiler to properly sequence and adjust system supply temperature.

⚠ WARNING
Burn and scald hazard. Verify all plastic caps are removed from boiler connections. Failure to follow these instructions could result in death or serious injury.
- Thoroughly flush all hydronic piping.
- Secure all valves/fittings to boiler.
- Ensure washers supplied are utilized.
- Face valves and fittings to rear wall.
- Fit union bends to valves.
  A. If soldering to boiler union bends, ensure bends are not connected to the valves, otherwise internal seals may be damaged.
  B. Verify 3/4" [22.2 mm] isolating valve with filter is fitted to heating return connection.
  C. Fit pressure relief valve connection vertically before heating isolating valve.
- Connect system valve pipe work to the boiler.
- Route pressure relief valve discharge piping to the floor. Follow local code with respect to necessary distance to the floor. See Figure 5-2.
- Verify all valves are closed.
Low Water Cutoff (LWCO) *(See Figure 5-6 for detail)*

Return

Note: Arrange piping to prevent water dripping onto boiler.

Note: Illustrations are meant to show system piping concept only. Installer is responsible for all equipment and detailing required by authority having jurisdiction.

Note: Do not place isolation valve before tee or lwco.
5.6 External Optional Low Water Cut Off

These guidelines are supplied when necessary to install an additional Low Water Cut Off (LWCO), for sensing a low water level condition in a boiler, as required by the Authority Having Jurisdiction.

Follow LWCO manufacturer installation instructions for type of LWCO selected in addition to these instructions.

LWCO shall be 120V/60HZ control and dry contacts sized for load being connected. Wire control to boiler. See Figure 5-4.

Connect LWCO device to the system ground. Ground in accordance with the requirements of the authority having jurisdiction or, in the absence of such requirements, with the National Electrical Code (NEC) or Canadian Electrical Code CEC.

- Locate LWCO sensing device in the supply piping, above the minimum height of boiler. See Figure 5-3, Piping Diagram.
- Position control in HORIZONTAL piping to assure proper boiler protection (upright or 90° rotation).
- For proper operation, sensing element of the LWCO control shall be positioned in the tee to sense the main water stream. Maintain minimum 1/4” spacing from pipe walls. Element shall NOT contact the rear, or side walls of the tee. See Figure 5-5.
- Install an air vent using a tee to avoid nuisance shutdowns.
- Apply small amount of pipe sealant to threaded connections.
- Arrange piping to prevent water dripping onto boiler.
- DO NOT install water shutoff valve between boiler and LWCO sensing device.

FIGURE 5-4 - LWCO Wiring Diagram

FIGURE 5-5 - Low Water Cutoff - Detail
A strainer filtering potable water before entering the boiler is highly recommended to prevent errors and lockouts. The strainer prevents any sedimentation and debris from your water supply piping from entering the boiler. Debris carried from the water supply will clog DHW water flow sensor resulting in error codes and causing boiler to lockout.

Locate the strainer as close to the boiler as possible and place on DHW (domestic hot water) inlet connection located at bottom of the boiler.
5.8 Central Heating System

Boiler is designed for use in a sealed central heating system. Design the system to operate with flow temperatures of up to 176°F (80°C), take pump head, expansion tank size, mean radiator temperature, etc. into account.

Boiler is supplied with the following components: Pressure relief valve - 30.0 psi (2.1 bar). Boiler internal pressure switch will shut boiler off at 43.5 psi /3.0 bar.

**Pressure gauge** - to indicate the system pressure to be maintained.

**By-pass** - Boiler incorporates an automatic by-pass, However, where all radiators are fitted with thermostatic radiator valves, an external by-pass must be fitted.

5.9 Domestic Hot Water Mode

Dunkirk DCC-150 & 205 and DCB 125 & 165 with indirect tank

• Flow of water will operate the DHW flow switch which requests the 3 way valve to change position. This will allow the pump to circulate the primary water through the DHW plate heat exchanger. (DCC 150 & 205 only)
• Combustion fan will then come on and begin to run at ignition speed.
• Once the fan reaches ignition speed the control board will allow power to flow to the spark generator and gas valve creating ignition in the combustion chamber. The flame sensor will acknowledge the presence of the flame in the combustion chamber and send a signal to the control board.
• Temperature sensors will send a signal to the control board allowing the control board to increase/ decrease the speed of the fan. The combustion fan will in turn modulate the gas rate accordingly.
• When the domestic hot water demand ceases the burner will extinguish, unless there is a demand for central heating.

5.10 Frost Protection Mode

Frost protection mode is integrated into the appliance when left in domestic hot water or central heating position. If the temperature falls below 41°F / 5°C boiler will fire on its minimum setting until flow temperature of 86°F / 30°C is reached.

5.11 Pump Protection

Pump will automatically operate for 1 minute in every 24 hours to prevent seizing.

---

**WARNING**

Burn, Scald Hazard! Water temperature over 125°F (51°C) can cause severe burns and scalding. See User’s Manual before setting water temperature. Failure to follow these instructions could result in death or serious injury.

• Priority is given to the domestic hot water supply. Demand at tap or shower will override any central heating requirement.
6 - COMBUSTION AIR AND VENT PIPING

**WARNING**

Fire, explosion, and asphyxiation hazard. Improper installation could result in death or serious injury. Read these instructions and understand all requirements before beginning installation.

**WARNING**

ABS/PVC venting shall not be used this product. Use of DWV plumbing pipes to vent this boiler shall be prohibited. Use of cellular core PVC (ASTM F891), cellular core CPVC, or Radel® (polyphenolsulfone) in venting systems shall be prohibited. Covering non-metallic vent pipe and fittings with thermal insulation shall be prohibited. Failure to follow these instructions could result in death or serious injury.

*Follow venting manufacturer’s equivalent lengths for specialty fittings.*

6.1 General

- Installations shall comply with Authority having jurisdiction and in absence of such with:
  - U.S. ANSI Z223.1/NFPA 54 in the United States
  - CSA B149.1 in Canada.
- This boiler requires a dedicated direct vent system.
- Vent connections serving appliances vented by natural draft shall not be connected into any portion of mechanical draft systems operating under positive pressure.
- Materials used in the U.S. shall comply with Authority having jurisdiction and in absence of such with: ANSI/ASTM D1785, ANSI/ASTM F441, ANSI/ASTF493, UL1738 or ULS636.
- Venting system must be free to expand and contract.
- Vent system must have unrestricted movement through walls, ceilings and roof penetrations.
- Check for proper joint construction when joining pipe to fittings.
- If vent is penetrating ceilings and floors, openings must have means of fire stopping in joist areas and proper firestop spacer assemblies installed.
- Standard roof flashing methods must be used to install roof flashing.
- Frame wall and roof openings to provide support for attachment of termination assemblies.
- Support piping in accordance with pipe manufacturer’s instruction and authority having jurisdiction. In absence of manufacturer’s instruction use pipe hooks, pipe straps, brackets, or hangers of adequate and strength located at intervals of 3 ft (1.0m) or less. Allow for expansion/contraction of pipe.
- Venting shall be supported adjacent to each joint using steel strapping or equivalent. See Figure 6-1.
- Support horizontal sections of vent pipe to prevent sags capable of accumulating condensate.
- Assemble vent materials in accordance with venting manufacturer’s instructions.
- Slope exhaust pipe minimum of 1/4” per foot, or vent manufacturer’s recommendation, whichever is greater; back toward the boiler.
- Any “in line” elbows in flue system must be taken into consideration. First elbow on the top of the boiler is included in equivalent length calculations.
- Use U.V. stabilized polypropylene when it will be exposed to sunlight, wind, or prone to freeze ups.

6.2 Removal of Existing Boiler From Common Vent System

When existing boiler is removed from common venting system, common venting system is likely to be too large for proper venting of appliances remaining connected to it. After removal of existing boiler, following steps shall be followed with each appliance remaining connected to common venting system placed in operation, while other appliances remaining connected to common venting system are not in operation:

- Seal any unused openings in common venting system.
- Visually inspect venting system for proper size and horizontal pitch. Determine there is no blockage or restrictions, leakage, corrosion and other deficiencies which could cause an unsafe condition.
- When practical, close all building doors, windows, and all doors between space in which appliances remaining connected to common venting system are located and other spaces of building. Turn on clothes dryer and any appliance not connected to common venting system. Turn on exhaust fans, such as range hoods and bathroom exhaust so they will operate at maximum speed. Do not operate summer exhaust fan. Close fireplace dampers.
- Turn on appliance being inspected. Follow lighting instructions. Adjust thermostat so appliances will operate continuously.
- Test for spillage at draft hood relief opening after 5 minutes of main burner operation. Use flame of match or candle, smoke from cigarette, cigar or pipe.
- Determine each appliance remaining connected to common venting system properly vents when tested as outlined above. Then return doors, windows, exhaust fans and any other gas-burning appliance to their previous condition of use.
- Any improper operation of common venting system should be corrected so installation conforms with National Fuel Code, ANSI Z223.1/NFPA 54 and/or Natural Gas and Propane Installation Code, CAN/CSA B149.1. When re-sizing any portion of common venting system, common venting system should be re-sized to approach minimum size as determined using appropriate tables in Chapter 13 of the National Fuel Gas Code, ANSI Z223.1/NFPA 54 and/or Natural Gas and Propane Installation Code, CAN/CSA B149.1.
6.4 Securing Twin Pipe Polypropylene Venting

Venting manufacturer’s use a device to secure single wall twin pipe polypropylene vent pieces to each other. Proper application of the securing mechanism is necessary for any use of twin pipe polypropylene venting on exhaust or air intake.

Securing mechanism is for indoor use only and should not be used in outdoor applications.

Follow venting manufacturer’s instructions for applying the securing mechanism on twin pipe polypropylene venting.

1. **Coaxial piping** – Figure 6-2 exhaust and air intake pipe have a common axis.

2. **Twin Pipe** – Figure 6-3 Exhaust and intake air are separate pipes, can be terminated using single wall terminals from the vent manufacturer or field built configuration using elbows or tees.

**Example for Natalini venting system.**
(For other venting system suppliers see their instructions.)

1. Place clamp so etched “UP” is facing up.
2. Open clamp slightly by separating circular areas from each other.
3. Slide male end of first pipe through open clamp so the shoulder of the female end of the pipe stops the clamp from sliding off the pipe.
4. Insert the male end of the second pipe into the clamp on the “up” etched side. Force the two pipes together.
5. Verify the two pipes are secure together with clamp in place.
6.5 Approved Venting Materials

**WARNING**
Manufacturer recommends this condensing boiler be vented with approved polypropylene venting material. Use only materials listed below for vent pipe, intake air pipe, and fittings. Failure to comply could result in death or serious injury.

**WARNING**
• Covering non-metallic vent pipe and fittings with thermal insulation shall be prohibited.
• Use of cellular core PVC for venting flue gas could result in death, or serious injury.
• Coaxial venting shall be fastened with screws. Dual flue venting is NOT fastened with screws.

**WARNING**
Do not use cellular core pipe. Only specified sized pipes are to be used. When using venting material other than boiler manufacturer’s venting, note the correct installation procedure. Failure to follow these instructions could result in death, or serious injury.

Installation shall conform to requirements of authority having jurisdiction or in absence of such requirements:

1. Venting shall be properly supported.
2. Boiler shall not support any type of vent system.
3. All piping, glue, solvents, cleaners, fittings and components must conform to ASTM and ANSI standards.
   In Canada ULC S636 and in the USA UL 1738 schedule 40 CPVC are the only approved vent system to be used as an alternative to polypropylene venting for the exhaust pipe.

4. Manufacturer requires use of a spring clamp at every push-fit gasket connection when using a single wall polypropylene vent system.

**Approved Polypropylene Manufacturers**

6.6 Vent Termination

- Terminate combustion air and vent pipes with fittings or coaxial vent kit.

Use horizontal pipe for vent and 90° elbow for combustion air termination when using fittings.

- Separate vent terminal from air inlet terminal to prevent flue gas recirculation. If T-Terminal is used on flue pipe at sidewall, air inlet terminal shall be at least 36” or more away from vent terminal.

- Locate combustion air termination as far as possible from swimming pool, swimming pool pump house, and other sources of airborne chlorine.

- Locate combustion air and vent terminals as required by authority having jurisdiction.

* Natalini
* DuraVent®
* Centrotherm
* Z-Flex®

Note: Maximum equivalent length may vary between manufacturers.

<td>1.64 ft [0.5m]</td>
</tr>
<tr>
<td>90°</td>
<td>3.28 ft [1.0m]</td>
</tr>
</tbody>
</table>

NOTE: Coaxial venting can run horizontal or vertical.

- Connect flue elbow to top of boiler and adjust direction of elbow to desired orientation (rear, right or left).
- Measure distance from outside wall face to elbow, this dimension will be known as "X", add distance "Y" + 2" (50mm) to "X" this is the total dimension of the vents. See Figure 6-6.
- Mark dimension from above on outer aluminum intake vent. Measure length of waste material, and transfer dimension to inner grey flue pipe.
- Remove waste from both vents (flue and air). Verify cut ends are square and free from burrs. Insert flue back into intake air vent and pass them through hole in wall.
- Check all measurements before cutting. Clearance to combustible materials is zero when using coaxial vent system.
- After installing venting use calibrated analyzer to verify there is no recirculation of combustion.
- Ensure termination is positioned with slots at the bottom.

6.8 Coaxial Vent Screw Placement - See Figure 6-5

Two (2) screws shall be fastened through the outer intake pipe behind the gaskets at equal distances, approximately 180° apart. Note the screws used must be no larger than No. 8-1/2 sheet metal screws and must be zinc coated. The length of the screws must be 3/4” (19.00mm).

WARNING

Asphyxiation hazard. Before securing the screws ensure the pipe has been pushed in a minimum of 1-3/4” (45mm) into the gasketed end of the other pipe. Failure to follow these instructions could result in death or serious injury.

6.9 Twin Pipe Systems
Twin pipe venting allows exhaust flue and intake flue to be separated from each other. Fresh air is drawn in at a different area from the flue terminal location.

A. Twin Pipe CPVC System
CPVC is approved for boiler exhaust. CPVC or PVC are both approved for air intake.
To transition from Coaxial at the top of the boiler to Twin Pipe CPVC/PVC a kit is available.

B. Twin Pipe Polypropylene System
Single wall polypropylene is used for both exhaust and air intake piping.
To transition from Coaxial at the top of the boiler to Twin Pipe polypropylene venting an adapter kit is available.

C. Twin Pipe Separated Flue
Exhaust and combustion air intake are not located in same general location.

D. Twin Pipe - Common Atmospheric Zone Termination
Exhaust and combustion air intake are located in same general location and are of equal length.

Note: Twin Pipe Common Atmospheric Zone termination can be run horizontal or vertical.
Roof Terminations

- 12" (305mm) Min. horizontal separation between combustion air intake and vent of same appliance.
- 12" (305mm) Min. 84" (2.2m) Max. vertical separation between combustion air intake and vent of different appliances.
- 15" (381mm) Max. horizontal length of vent.
- Min. vent/intake between different appliances 12" (305mm).
- Max. allowable total vertical vent length with outside exposure is 10 ft. (3.05m).
- Abandoned unused masonry chimney may be used as chaseway for combustion air and vent. Both combustion air and vent pipe must exit above top of chimney with clearances as shown in Figure 6-14.

Figure 6-17 - (3" ONLY) Twin Pipe Side Wall Vent (CAN BE USED ON 165 & 205 ONLY)

Figure 6-18 - (3" ONLY) Twin Pipe Side Wall with 45° Vent (CAN BE USED ON 165 & 205 ONLY)

</tbody>
</table>

Note: Flexible vent systems shall only be run vertical. Horizontal runs before adapting to flexible must be rigid pipe.

- Maximum vent lengths based on equivalent straight runs only. Include rigid pipe and fittings in overall equivalent length calculations.
- Flexible venting installations use single wall polypropylene to pass flue gasses to base of chimney, then flexible venting to get them to termination at the top.
- Combustion air is not supplied through masonry chimney. Combustion air must be from outside using 3” [80 mm] single wall polypropylene.
- Position boiler to use minimum of rigid single wall polypropylene venting to the chimney.
- Follow venting manufacturer's instructions on assembly and clearances to maintain.
- Avoid sharp bends in flexible venting.
All vent pipe and combustion air pipe and fittings shall comply with the following:

Materials used in the U.S. must comply with the following standards:
ANSI/ASTM D1785, ANSI/ASTMD2661, ANSI/ASTM F441.

### Vent Termination Minimum Clearances

</tr>
</tbody>
</table>

† A vent shall not terminate directly above a sidewalk or paved driveway that is located between two single family dwellings and serves both dwellings.
‡ Permitted only if veranda, porch, deck or balcony is fully open on a minimum of one side beneath the floor.

*For clearances not specified in ANSI Z223.1/NFPA 54 or CSA B149.1, clearance will be in accordance with local installation codes and the requirements of the gas supplier and these installation instructions.

**Note:** Local Codes or Regulations may require different clearances. Flue terminal must be exposed to external air and position must allow the free passage of air across it at all times. In certain weather conditions the terminal may emit a plume of steam. Avoid positioning terminal where this may cause a nuisance.
6.11 Condensate Piping

- Use materials acceptable to authority having jurisdiction. In absence of such authority:
  - USA - PVC or CPVC per ASTM D1785/D2845 Cement or primer per ASME D2564 or F493.
- No external trap needed.
- Connect condensate hose, hose clamps, and coupling to boiler drain trap as shown in figure 6-24.
- Connect condensate piping to 3/4" PVC for 165/205 or 1/2" PVC for 125/150 as shown.
- Slope condensate drain pipe minimum 1/4" per foot (21mm/m) away from boiler.
- Support condensate pipe to eliminate any sages.
- Use field source condensate pump, designated for use with condensing boiler, if boiler located below disposal point.
- Condensate pump should have overflow switch. Condensate from Boiler is slightly acidic and may cause property damage if overflow.
- Field source condensate neutralizing kit as required by authority having jurisdiction or for environmentally friendly condensate disposal.

**NOTICE**

Manufacturer requires an air vent be used to prevent condensate line vacuum lock.
7 - GAS SUPPLY PIPING

### 7.1 General
- Use piping materials and joining methods acceptable to authority having jurisdiction. In absence of such requirements:
  - USA - National Fuel Gas Code, ANSI Z223.1/NFPA 54
- Install manual main shutoff valve before the gas valve accordance with state and local requirements.
- Size and install gas piping system to provide sufficient gas supply to meet maximum input at not less than minimum supply pressure.
  - A. DCB-125 requires a gas rate of 137.60 ft³/h (3.90 m³/h) for Gas A (Natural Gas) and 101.30 ft³/h (2.87 m³/h) for Gas E (Liquid Propane Gas).
  - B. DCC-150 requires a gas rate of 167.20 ft³/h (4.74 m³/h) for Gas A (Natural Gas) and 122.80 ft³/h (3.48 m³/h) for Gas E (Liquid Propane Gas).
- Gas meter and supply pipes must be capable of delivering the listed quantity of gas in addition to demand from any other appliances in the house. Boiler requires a 3/4” (19.5 mm) gas supply pipe.
- Support piping with hooks straps, bands, brackets, hangers, or building structure components to prevent or dampen excessive vibrations and prevent strain on gas connection. Boiler will not support piping weight.
- Use thread (joint) compound (pipe dope) suitable for liquefied petroleum gas.
- Install external field sourced manual main gas shutoff valve, ground joint union, and sediment trap upstream of gas controls.
- Install boiler so gas ignition system components are protected from water dripping, spraying, rain, etc. During appliance operation and service.
- Leak test boiler and gas line connections before placing boiler into operation.

### 7.2 Leak Check Gas Piping
Pressure test boiler and gas connection before placing boiler in operation.
- **Pressure test over 1/2 psig (3.5 kPa). Disconnect boiler and its individual gas shutoff valve from gas supply system.**
- **Pressure test at 1/2 psig (3.5 kPa) or less. Isolate boiler from gas supply system by closing manual gas shutoff valve.**
- Locate leakage using gas detector, noncorrosive detection fluid, or other leak detection method acceptable to authority having jurisdiction. Do not use matches, candles, open flames, or other methods that can provide ignition source.
- Correct leaks immediately and retest.

### Notice
Sediment trap shall be located upstream of gas controls.

### CAUTION
**WHAT TO DO IF YOU SMELL GAS**
- Do not try to light any appliance.
- Do not touch any electrical switch; do not use any phone in your building.
- Immediately call your gas supplier from a neighbor’s phone. Follow gas supplier’s instructions.
- If you cannot reach your gas supplier, call the fire department.

### WARNING
Fire, explosion, asphyxiation and burn hazard. Boiler piping and gas connections shall be leak tested before placing boiler in operation. Failure to follow these instructions and or improper installation could result in death or serious injury.

### DANGER
Fire Hazard. Do not use matches, candles, open flames, or other methods providing ignition source. Failure to comply will result in death or serious injury.

### WARNING
If overheating occurs or gas supply fails to shut off, do not turn off or disconnect the electrical supply to the pump. Shut off gas supply at a location external to the appliance. Do not use this boiler if any part has been under water. Call a qualified service technician before use.

### NOTICE
If overheating occurs or gas supply fails to shut off, do not turn off or disconnect electrical supply to pump. Shut off gas supply at location external to the boiler.
8.1 General
Electrically bond boiler to ground in accordance with requirements of authority having jurisdiction. Refer to:
- USA- National Electrical Code, ANSI/NFPA 70.
- Install all wiring in accordance with requirements of National Electrical Code and any additional national, state, or local code requirements having jurisdiction.
- All wiring shall be N.E.C. Class 1.
- Boiler shall be electrically grounded in accordance with the National Electrical Code, ANSI/NFPA No. 70-latest edition.
- Boiler requires a 120V 60Hz power supply. Ensure electrical supply is polarized.
- There shall only be one common isolator, providing complete electrical isolation, for boiler and any external controls. Using PVC insulated cable 12 AWGx3C 221°F (105 ºC).

8.2 Install Room Thermostat
Install room thermostat on inside wall. Do not install where it will be influenced by drafts, hot or cold water pipes, lighting fixtures, television, sunrays or near a fireplace.

8.3 Electrical Connections
- Boiler requires 120V 60Hz power supply. Verify electrical supply is polarized.
- Boiler shall be grounded and on dedicated circuit.
- Shall be one common isolator, providing electrical isolation for boiler and any external controls. Using PVC insulated cable 18 AWGx3C 221°F (105ºC).
- All wiring must be installed in accordance with requirements of the National Electrical Code and any additional national, state, or local code requirements having jurisdiction. All wiring must be N.E.C. Class 1.
- Canada, installation must conform to CSA C22.1 Canadian Electrical Code Part 1 and any local codes.
- If replacing original boiler wiring use only TEW 105ºC or equivalent.
- If appliance is connected to in floor system, install limit thermostat to prevent latter from overheating.

**Note**
Wiring diagrams can be found in Appendix A of this Manual.

**FIGURE 8-1 Electric Knockouts Bottom Of Boiler**
Illustration shown (size 205), illustration is for location purposes, wiring knockouts found same general location on all sizes.

DANGER
Electrocution Hazard! HIGH VOLTAGE - Connections in terminal block M1 are high voltage (120V / 60Hz). Before making connections, verify appliance is disconnected from power supply. Respect the input polarity on terminal block M1: L (LINE) - N (NEUTRAL). Failure to follow these instructions WILL result in death or serious injury.

8.4 Access To Connection Block
1. Ensure there is no line voltage at boiler.
2. Un螺丝 two screws located under front panel. Remove front cover.
3. Guide controller or thermostat wire through round grommet(s) on right side of boiler’s bottom plate right.
4. Tilt control box forward by opening holding clips located on left side of boiler.
5. Expose M1 and M2 terminal blocks by removing screw from plastic cover on left. See Figure 8-3.
6. Remove plastic from channel in plastic cover. Run wires through new opening.
7. Connect wires to appropriate terminals on connection block.
8. Tilt control box back to original position. Ensure clip on left side is fully engaged.
9. Replace front cover and screws under front panel.
10. Turn power to boiler on.

Various thermostats and controllers can be connected to standard control PCB.

8.5 Main Supply Connection
Main supply is connected to terminal block M1 which is high voltage (120V / 60Hz). Fuses, 3.15 A, are incorporated in the power supply terminal block. To check or replace fuse pull out black fuse carrier.

TERMINAL BLOCK M1
(L) = Live (brown)
(N) = Neutral (light blue).
= Ground (yellow-green).
(1) (2) = contact for 120V Room Thermostat.
Place jumper back on terminals 1-2 of boiler terminal block M1 if room thermostat is not used or if Remote Control is not installed.

TERMINAL BLOCK M2
Terminals 1 - 2: bus connection of programmable room unit (supplied as accessory)
Terminals 4 - 5: outdoor temperature sensor connection (supplied as accessory)
Terminal 3: not used.
Terminals 6 - 7 - 8: see section 8.6.
Terminals 9 - 10: Indirect storage tank sensor connection for Dunkirk Models DCB-125 & 165.
8.6 Install Room Thermostat
Install room thermostat on inside wall. Do not install where it will be influenced by drafts, hot or cold water pipes, lighting fixtures, television, sun rays or near a fireplace.

**Dry contact only - do not apply 24 volts between 6 and 7.**

**A. Connect Room Thermostat**
- turn power off to boiler;
- access terminal block M2;
- connect room thermostat to terminals 6(R)-7(W)-8(C); Do not apply dry volt between 2 terminals. Dry contact only.
- turn boiler power on;
- verify room thermostat operates per thermostat manufacturer instructions.

**NOTE:** maximum load allowed is 10 mA

**B. Connect Heat Anticipator Room Thermostat**
- turn power off to boiler;
- access terminal block M2;
- connect wires of Heat anticipator room thermostat to terminals 6-7;
- connect bridge between terminals 6-8;
- turn boiler power on;
- verify 24 V Heat anticipator room thermostat operates per thermostat manufacturer instructions.

![Thermostat Connections Diagram](image-url)
8.7 Optional Electrical Connections

A. 1K Ohm (1K Ω) Outdoor Temperature Sensor
To connect this accessory, see figure 8-5, terminals 4-5, and instructions supplied with 1K Ω sensor.

B. Setting "Kt" Climate Curve
When external 1K Ω sensor is connected to boiler, the electronic board adjusts the flow temperature calculated according to set Kt coefficient.
Select required curve by pressing as indicated in chart below for selecting the appropriate curve (00 to 90).

---

**Note**
Sensors used for this boiler are proprietary to the manufacturer. Use of after market sensors will diminish boiler performance.

---

**FIGURE 8-5 Outdoor Sensor Connections**

**FIGURE 8-6 Kt Climate Curves**

---

**NOTE:**
Temperatures below -40 °F (-40 °C), maximum heating flow temperature set point no longer increases, curves shown on graph become horizontal.
### 8.8 Indirect Storage Tank

Boilers DCB-125 and DCB-165 can be electrically connected to indirect storage tank as follows:

- Connect DHW priority 10K Ω sensor NTC to terminals 9-10 on terminal block M2.
- Insert 10K Ω NTC sensor element in the sensor well of indirect storage tank.
- Verify exchange capacity of the storage boiler coil is appropriate for boiler power.
- Adjust DHW temperature +95 °F...+140 °F (+35 °C...+60 °C) by pressing + on boiler Controll.

**IMPORTANT: set parameter P03 = 05 as described in: "PARAMETER SETTINGS".**

**Note**

Sensors used for this boiler are proprietary to the manufacturer. Use of after market sensors will diminish boiler performance.

**FIGURE 8-7A Kt Indirect Storage Tank**

9.3 System Start Up
Follow all codes and regulations when filling the boiler. Use drain taps to allow system to completely drain. Thoroughly flush the heating system before boiler is connected and again after first heating.

- Boiler is fitted with automatic air vent positioned on pump Vent and is fitted with adjustable sealing cap. See Figure 9-1.
- Open central heating flow and return valves. Spindle is flat in-line with valve.
- Open fill point valve on filling system until water begins to flow. To aid venting boiler drain may be open until water flows out. Close drain as soon as water appears.
- Systems using radiators to remove air - Vent each radiator in turn, starting with lowest in the system.
- It is important the pump is properly vented to avoid running it dry and damaging its bearings. Unscrew and remove cap from center of pump. Use screwdriver. Rotate exposed spindle about half turn, replace cap.
- Check operation of heating pressure relief valve. Pull lever on top of valve upwards lifting the seat. This will allow water to escape from system. Check water is escaping from the system.
- Open cold water supply inlet valve. Turn on all hot water taps. Allow water to flow until no air is present. Turn off taps. See page 4- Physical Data and section 2.7 Operational Features.

9.4 Fill Condensate Trap with Water

**WARNING**
Asphyxiation hazard! Fill condensate trap before starting boiler to avoid combustion products escaping boiler. Failure to follow these instructions could result in death or serious injury.

- To fill the condensate trap pour water into exhaust vent until water begins to flow through the siphon.
- Visually inspect the siphon to ensure it is full with clean water.
- During operation check condensate trap to ensure it draining properly.

**Note**
Condensate trap must be manually filled with water at initial start up.
9.5 Control Panel
Press and hold \( \text{iP} \) for 1 second, to display information as shown in the table below.

Press \( \text{O/R} \) to exit.

9.6 Commissioning

When lighting the boiler for the first time perform the following procedure:

1. Turn power to boiler on. Code "000" appears on the display. Appliance is ready for "commissioning" procedure.

2. Press [ ] and [ ] at the same time. Hold for 6 seconds. "On" appears on the display for 2 seconds followed by code "312" indicating "de-aeration" function is active. This function lasts 10 minutes.

3. Boiler will turn on after deaeration function is complete. Display will show code "000" alternating with % of ignition power and temperature value (°F / °C).
   - During this gas recognition function phase which lasts about 7 minutes, type of gas being used is analyzed.
   - During this function, assure maximum heat exchange to heating or DHW system (domestic hot water demand) by having all heating zones open or all domestic hot water taps open, in order to prevent boiler from switching off due to overheating.
   - If boiler operates on Gas A (Natural Gas), display shows NG (Natural Gas) for about 10 seconds. Boiler is now ready for normal operation.
   - If display shows LPG (Gas E), press [ ] and [ ] together and hold down for at least 4 seconds to exit without changing factory setting. Boiler will stay set to Natural Gas.
   - If boiler operates on Gas E (LPG) display shows LPG (Gas E). Press [ ] for at least 6 seconds to confirm gas used.
   - If display shows NG (Gas A) and does not recognize the type of gas used, press [ ] and [ ] together and hold down for at least 4 seconds to exit the function. Then change parameter P02=01 as described in section 9.12 Parameter Settings of boiler Installation, Operation and Maintenance Manual.

9.7 Calibration Function:

Boiler must be in stand by mode (no requests) before initiating the function.

The function consists of an automatic sequence and a manual sequence.

Automatic Sequence

a. Press together for 6 seconds the [ ] and [ ] buttons and then within 3 seconds the [ ] button. After 6 seconds it is possible hear a 'click' of the gas valve and see 'On' on the display;

b. The function is active if [ ] and [ ] blink together;

c. After ignition (also more than one attempt) the boiler works at maximum power for at least 1 minute, then at the ignition power, and at the end at minimum power. When the display shows $p$ and $\mathcal{A}$ icons it means the value of the curve has been stored. During the function the display shows the power level and flow temperature alternately.

Boiler must not shut off during calibration. Open all heating zones in heating or DHW mode to ensure boiler does not shut off.

IMPORTANT INFORMATION

A. If venting or gas recognition function is interrupted by power blackout, start function again when power is restored. Press [ ] and [ ] together and hold at same time for at least 6 seconds.

B. If display shows fault E118 (low pressure in hydraulic circuit) during venting function, open filling tap on appliance and restore correct pressure.

C. If gas recognition function is interrupted due to fault (e.g.: E133 no gas) press [ ] to reset. Then press [ ] and [ ] (for at least 6 seconds) to restart the function again.

If gas recognition function is interrupted due to overheating, restart function by pressing and holding down together for at least 6 seconds.
D. Combustion of this appliance has been factory controlled, calibrated and set for operation with **Gas A** (Natural Gas).

E. During Gas Type Control Function, combustion ratio will increase for a short period of time while gas type is being established.

### 9.8 De-Aeration Function

Used to eliminate air inside the heating circuit when boiler is installed or after maintenance when water is drained from primary circuit.

1. Press buttons together and hold for 6 seconds. **On** appears on display for a few seconds, followed by program row **312**.

2. The electronic board will activate pump on/off cycle for 10 minutes. Function will automatically stop at end of the cycle.

3. To manually exit this function, press buttons together and hold for 6 seconds.

### 9.9 Commission Set Up (Gas) - Changing The Type Of Gas

During the **first** installation boiler carries out an automatic commissioning function. The system is able to detect the gas type present in the network.

Correct gas type setting, is made by pressing two buttons at the same time, see section 9.6 Commissioning.

Change of gas type is made **after** the first installation:

- **Change parameter P02.** See section 9.6 Commissioning and section 9.11 Parameter Settings.

- **Check minimum gas pressure is suitable for selected gas:**
  - Gas A (NG) = 3.5" (8.7mbar)
  - Gas E (LPG) = 8.0" (19.9mbar)

- Place supplied label with indication of gas type close to the data plate of boiler replacing the original.

- Manufacturer recommends verification of CO$_2$ concentration on the flue.
9.10 Chimney Sweep Function (CO₂ Adjust)

For correct boiler operation, content of (CO₂ - O₂) in the combustion flue must be within tolerances indicated in table below.

**COMBUSTION TABLE**

</tbody>
</table>

(*) Automatically calculated from the PCB

Chimney Sweep Function enables boiler to generate maximum heating power.

After activation, boiler power % can be adjusted from minimum (0%) to maximum (100%) in DHW mode.

A. Press and hold [long] and [short] at the same time for 6 seconds. When the function is enabled, displays shows “On” for few seconds followed by program row “303” alternating with % of boiler power.

B. Press [long] to gradually adjust power (increments of 1%).

C. To exit press both buttons together for at least 6 seconds.

If value of CO₂-O₂ is different, check the electrodes and their relative distances. See Figure 11-1.

If necessary, replace electrodes and position them correctly. If problem persists, use **COMBUSTION ADJUSTMENT FUNCTION (CO₂ %)**. See Section 11 General Maintenance, Figure 11-1 Electrodes.

**NOTICE**

- Press [short] to display instantaneous flow temperature for 15 seconds.
- Use a regularly calibrated combustion analyzer for combustion analysis.
- During normal operation boiler performs combustion control cycles. In this phase CO values higher than 400 ppm can occur for brief periods of time.

9.11 Combustion Adjustment Function (CO₂ %)

This function sets out to partially adjust the value of CO₂%.

Use the following procedure:

1. Press buttons [long] and [short] together for at least 6 seconds. When the function is enabled, displays shows “On” for a few seconds followed by program row “304” alternated with the % of boiler power;

2. After burner is lit, boiler reverts to maximum DHW power (100). When display shows “100” it is possible to partially adjust value of CO₂ %;

3. Press [long] and [short]. Display shows “00” alternating with function number “304” ( flashes);

4. Press [long] to raise or lower the amount of CO₂ (from -3 to +3);

5. Press [short] to save new value. Power value “100” will show on display again. Boiler continues operating at maximum DHW power.

This procedure can be used to adjust CO₂ to ignition power and minimum power by pressing [long] after performing step 5 above.

6. After saving the new value (step 5 above), press [long] to set boiler to ignition power. Wait for value of CO₂ to stabilize. Adjust as described in step 4 of procedure (power value is a number <> 100 and <> 0). Repeat step 5 to save.

7. Press [long] to adjust boiler to minimum power. Wait for value of CO₂ to stabilize. Go to step 4 to adjust (power value = 00);

8. Exit function by pressing [long] and [short] together for at least 6 seconds, see step 1.

9.12 Check Firing Rate

1. Measure input, if a gas meter is installed in the system.
   - Turn off gas to all other appliances.
   - Activate some heating zones to dissipate heat.
   - Set boiler on high fire using Chimney Sweep Function.
   - Use ½, 1 or 2 cu ft dial on gas meter. Measure time required for two or more complete revolutions. Measure time for one or more minutes.
   - Calculate input.
9 - START UP PROCEDURE

For Natural Gas:

Input (MBH) = \frac{3600 \times \text{cu ft}}{72 \text{ seconds}}

Example: Natural Gas - Gas flow from Meter = 2 cu ft Measured time = 72 seconds

= \frac{3600 \times 2 \text{ cu ft}}{72 \text{ seconds}} = 100 \text{ MBH}

For Propane (LP):

Input (MBH) = \frac{9160 \times \text{cu ft}}{72 \text{ seconds}}

For Metric formulas- See Glossary

2. Compare measured input to table below. If calculated input is not in range given in Table below, check firing rate again after setting the combustion following steps in section 9.10.

9.14 Description Of Parameters: Factory Settings

9.13 Parameter Settings

Program boiler electronic board parameters as follows:

- Press and together, hold them down for 6 seconds until program “P01” appears on the display alternated with the set value;
- Press or to scroll the list of parameters;
- Press , value of selected parameter begins flashing, press to change the value;
- Press to confirm the value or press to exit without saving.

Further information in regards to parameters listed in the following table are supplied together with required accessories if necessary.

### 9.15 Adjusting Maximum Heating Power

Maximum boiler heating power can be reduced to suit requirements of heating system it serves. Table showing parameter \textbf{P13} values according to desired maximum power model is shown for each single boiler. To access and edit \textbf{P13} values, proceed as described in Parameter Settings.

#### Boiler Model - PARAMETER P13 (%)/ Heating Output

FOR YOUR SAFETY READ BEFORE OPERATING

⚠️ WARNING
If you do not follow these instructions exactly, a fire or explosion may result causing property damage, personal injury or loss of life.
• This appliance is equipped with an ignition device which automatically lights burner. **Do NOT try to light this burner by hand.**
• Before operating smell all around appliance area for gas. Be sure to smell next to floor because some gas is heavier than air and will settle to the floor.
• **Use only your hand to turn the gas shutoff valve.** Never use tools. If valve will not turn by hand, do not try to repair it, call a qualified service technician. Force or attempted repair may result in fire or explosion.
• **Do not use this appliance if any part has been under water.** Immediately call a qualified service technician to inspect appliance and to replace any part of control system and any gas control which has been under water.

⚠️ CAUTION
WHAT TO DO IF YOU SMELL GAS
• Do not try to light any appliance.
• Do not touch any electrical switch; do not use any phone in your building.
• Immediately call your gas supplier from a neighbor’s phone. Follow the gas supplier’s instructions.
• If you cannot reach your gas supplier, call the fire department.

10.1 Boiler Sequence Of Operation
• With demand for heating, pump circulates water through the primary circuit.
• Combustion fan will come on and begin to run at ignition speed.
• Once fan reaches ignition speed control board will allow power to flow to spark generator and gas valve creating ignition in combustion chamber. Flame sensor will acknowledge presence of flame in combustion chamber and send signal to control board.
• Temperature sensor will send signal to control board allowing control board to increase / decrease fan speed. Combustion fan will in turn modulate gas rate accordingly.
• Once central heating loop temperature exceeds central heating loop setpoint the unit will shutdown and go through 3 minute time delay (burner pause time) before another call for heat.
• During this time the pump will run for additional three minutes to dissipate any residual heat.

10.2 Testing For Gas Leaks And Purging The Gas Supply
• With boiler gas service cock closed (spindle flats at right angles to valve). Pressure test gas supply and inlet pipe work connection to boiler gas service cock for soundness.
• Loosen screw of pressure inlet gas test port on gas valve. See section 13.4 Gas Valve. Verify gas supply is ON. Open boiler service cock to purge.
• Retighten test port screw and test for gas leaks. Close boiler gas shutoff device.
10.3 Boiler Controls
To light boiler correctly, proceed as follows:
- Check system pressure is correct;
- Power boiler;
- Open gas tap (positioned under boiler);
- Select required heating mode. See section 10.4 Operating Modes.

</table>
10.4 Boiler Operation
Domestic hot water supply always takes priority over central heating.
Demand for hot water required during central heating period, boiler automatically switches to hot water mode until demand is satisfied i.e. storage water is to required temperature. This interruption in central heating is only when demand for hot water is present and should not be noticed by the User.

10.5 Central Heating Mode
1. Call for heat. Pump will start to circulate central heating water, operating the flow switch.
2. Fan will run. Once fan speed is reached burner will light.
3. Burner output automatically adjusts to suit system demand; as temperature of water in boiler approaches that set by adjustable temperature selector, burner output is reduced.
4. When set temperature is reached, burner is turned off and fan stops. Pump continues to run for three minutes to remove residual heat build up in boiler. Burner will not relight for 3 minutes.
5. If CH sensor has not registered pre-set temperature but room thermostat is satisfied the burner is turned off. Fan stops. Pump continues to run for three minutes. In this instance there is no 3 minute delay before burner relights.
6. If there is demand for DHW during 3 minute burner delay, boiler will operate to provide DHW until tap is closed. Boiler will immediately revert to provide CH if there is demand.

10.6 Domestic Hot Water Mode
- Flow switch senses demand for hot water (opening a hot water tap, etc.), the pump starts and burner lights at its ignition output, increasing to its maximum output.
- Water in the boiler is diverted from central heating system to domestic hot water heat exchanger, heating the incoming supply water.
- Burner output is varied to maintain temperature of hot water as set by the adjustable temperature selector.
- When flow switch senses hot water is no longer required burner is turned off. Boiler immediately returns to central heating mode.

10.7 Frost Protection
Boiler has a built in frost thermostat which automatically turns boiler and pump on.
If water in boiler falls below 41°F (5°C), providing the display is switched on, boiler will operate until water temperature in the system reaches approximately 86°F (30°C).
Frost protection is for the boiler only and not for complete Central Heating System.

10.8 Pump
If display is switched on and boiler has not operated for 24 hours for heating or hot water, pump will operate automatically for five minutes every 24 hours.

10.9 Low Water Pressure Sensor (Internal)
This device protects the primary exchanger from damage. It will not allow the boiler to run in a LOW water pressure situation. Low water condition occurs when water pressure drops below 7.0 psi (0.5 bar), approximately.
11.1 Beginning of Each Heating Season

- Check boiler area is free from combustible materials, gasoline, and other flammable vapors and liquids.

- Visually inspect combustion air and vent piping for proper operation. Check for and remove any obstruction to flow of combustion air or vent gases. Immediately repair or replace pipe showing deterioration or leakage. Reassemble per instructions in section 6. Ensure proper reassembly and resealing of system.

- Visually inspect condensate drain line for proper operation. Checking for deteriorated or plugged condensate drain line. Verify condensate trap drains freely and clean as required.

- Test safety relief valve for proper operation. Refer to valve manufacturer's instructions packaged with relief valve.

- Examine heat exchanger, burner, condensate lines, and clean (if necessary) by following instructions in section 11.3-Component Replacement And Cleaning.

- Circulator pump and combustion air blower motor furnished with boiler are permanently lubricated from factory and require no further lubrication. Lubricate field sourced pumps and/or motors according to pump and/or motor manufacturer's instruction.

- Check following components are operating properly and are free of blockages or obstructions:
  - air vent;
  - check venturi air inlet for blockage and clean as required;
  - verify pressure test port cap and combustion test port are in place;
  - return temperature sensor clip (if equipped) must be securely seated on pipe; Check boiler for any sign of leaks.

- Check external low water cutoff operation (if installed).
  - Check operation by pressing test button on low water cutoff.
    - "Low Water" LED on the external LWCO should illuminate and boiler should shut down.
  - Every 5 years remove low water cutoff. Reinstall after cleaning.
  - Every 10 years replace low water cutoff.

- Visual inspection of flame through sight glass. Burner should be fully illuminated.

- Check heating system expansion tank.

Note

Verify proper operation after servicing.

Perform regular service and maintenance by qualified service agency at least once every 12 months to assure safe, trouble free operation and maximum efficiency.

A Heat Exchanger cleaning kit is available for annual service of the boiler. See repair parts manual for part number.

Note

Label all wires prior to disconnection when servicing controls. Wiring errors can cause improper and dangerous operation.
**11 - GENERAL MAINTENANCE AND CLEANING**

**WARNING**
Following service procedures must be performed by qualified service agent. Boiler owner shall not attempt these steps. Failure to do so could result in death or serious injury.

**WARNING**
Combustion chamber insulation in this product contains ceramic fiber material. Ceramic fibers can be converted to cristobalite in very high temperature applications. The International Agency for Research on Cancer (IARC) has concluded, Crystalline silica inhaled in the form of quartz or cristobalite from occupational sources is carcinogenic to humans (Group 1). Avoid breathing dust and contact with skin and eyes. Use NIOSH certified dust respirator (N95). This type of respirator is based on the OSHA requirements for cristobalite at the time this document was written. Other types of respirators may be needed depending on the job site conditions. Current NIOSH recommendations can be found on the NIOSH website http://www.cdc.gov/niosh/homepage.html. NIOSH approved respirators, manufacturers, and phone numbers are also listed on this website. Wear long sleeved, loose fitting clothing, gloves, and eye protection. Apply enough water to the combustion chamber lining to prevent dust. Wash potentially contaminated clothes separately from other clothing. Rinse clothes washer thoroughly. NIOSH stated First Aid. Eye: Irrigate immediately. Breathing: Fresh air.

**WARNING**
Before servicing, turn off electrical power to boiler at service switch. Close manual gas valve to turn gas supply OFF to boiler. Test for gas leaks on any gas carrying components after servicing. Service not complete until appliance operation verified per Installation, Operation & Maintenance Manual provided with boiler.

**CAUTION**
Label all wires prior to disconnection when servicing controls. Wiring errors can cause improper and dangerous operation. Failure to follow these instructions could result in minor or moderate injury.

**NOTICE**
Perform regular service and maintenance by qualified service agency at least once every 12 months to assure safe, trouble free operation and maximum efficiency.

**11.2 Maintenance And Routine Servicing**
Check and service boiler as necessary. Frequency of servicing will depend upon installation conditions and usage, manufacturer recommends annually.
- Check flue terminal outside and ensure it is not blocked.
- Operate boiler. Check operation of boiler’s controls.
- Ensure all system connections and fittings are sound. Correct any joints and fittings that maybe leaking.
- Follow safety valve manufacturer recommendations for service.

To ensure boiler operates at peak efficiency, following checks must be performed every year:
- check appearance and tightness of gas and combustion circuit gaskets
- check condition and position of ignition and flame sensing electrodes
- check condition of burner and its connection to aluminum front plate
- check for dirt in combustion chamber. Use vacuum cleaner for this cleaning operation
- check gas valve is calibrated correctly
- check there is no dirt in condensate trap
- check central heating system pressure
- check expansion tank pressure
- check vent system, clean if necessary

Record details and maintain service history.

**11.3 Component Replacement And Cleaning**
1. Remove any deposits from heat exchanger using suitable soft brush. Do not use brush with metallic bristles.
2. Check condition of the combustion chamber insulation panels. Any damaged panels must be replaced.
3. Check condition of burner injector on the manifold, carefully clean it with a soft brush if necessary. Do not use a brush with metallic bristles this might damage the injector.
4. Remove any fallen deposits from bottom of inner case.
5. Clean burner with soft brush and check flame ports are clear. Blockages may be removed with stiffer brush.
6. Check condition of electrodes.
7. Check spark gap, positioning and height of electrodes.
8. Check fan impeller is clean and free to rotate.
Before servicing, turn off electrical power to boiler at service switch. Close manual gas valve to turn gas supply OFF to boiler. Failure to comply will result in death or serious injury.

11.4 Draining the Boiler
- turn boiler off
- isolate electrical supply
- close boiler gas service cock
- allow boiler to cool
- drain boiler through onboard drain if available or external drain valve.

11.5 Draining the Heating Circuit
- Follow all steps in 11.4.
- Close central heating flow and return valves.
- Connect suitable pipe to drain point.
- Route it to suitable container.
- Open drain tap.

11-1 ELECTRODES
11.6 Hydraulic Unit (DHW)
For special areas, where water is harder than 200 ppm or 12 grains/gallon, install polyphosphate dispenser or equivalent treatment system, compliant with current regulations.

11.7 Cleaning The Cold Water Filter
Boiler is fitted with cold water filter located on DHW hydraulic assembly (B). To clean:
- Drain domestic hot water system. (C - 150 only)
- 165 Drain is field supplied/installed.
- Remove nut on DHW priority sensor unit using 18mm wrench. (B)
- Pull out flow sensor and its filter.
- Remove any impurities.

**NOTICE**
When replacing and/or cleaning “O-rings” on hydraulic assembly (DHW), use only Molykote 111 as a lubricant, not oil or grease.

11.8 Final Commissioning
- Allow heating system to heat. Balance the system to achieve temperature difference across heating supply and return pipes at the boiler.
- Check system for proper volume and pressure. See page 4 for acceptable volume and pressure.
- Turn off boiler.
- Thoroughly flush water pipe work. Clean filters in heating return and supply water isolating valves.
- Repressurize the system.

11.9 Final Assembly
- Place front jacket in position over boiler. Ensure bottom is located behind the control panel. Secure in position at top using screws previously removed.
- If boiler is to be left in service with the User, set controls and room thermostat.
- If boiler is not to be handed over immediately, close boiler gas service valve and turn off electrical supply.
- If there is possibility of boiler being left during frost conditions drain boiler and system. See section 11: Component Replacement Or Periodic Cleaning. Manufacturer recommends attaching a label to the boiler drawing attention to the fact that the system has been drained.
11.10 User Information
Advise and demonstrated to User the following important information:

A. How to light and turn off boiler. How to operate system controls.
B. Importance of annual servicing of boiler to ensure safe and efficient operation.
C. Servicing or replacement of parts shall be carried out by a qualified personnel.
D. Ensure boiler controls and room thermostat, if fitted, are set to User's requirements.
E. Tell User about sealed system pressure.
F. Tell User if display is active and boiler has not operated for 24 hours for heating or hot water, the pump will automatically operate for 5 minutes.
G. Explain to User an internal frost thermostat is fitted in boiler, and electrical supply to boiler must be left on for thermostat to operate.
H. Show User position of pressure relief valve discharge pipe.
I. Leave this Installation, Operation and Maintenance Manual with User for use on future calls.

11.11 Safety Flue Thermostat - DO NOT disable this safety device.
Safety Flue Thermostat found on the flue inside the boiler, interrupts flow of gas to the burner if the temperature overheats.
After verifying the cause of the trip, press \( \text{ boiler } \) for about 2 seconds.

11.12 Flue Pressure Switch - DO NOT disable this safety device.
This device, positioned inside the sealed chamber, interrupts flow of gas to the burner if flue pressure exceeds 1.6 in w.c. (4 mbar). Verify if vent is blocked before resetting the boiler.

11.13 Replacement Parts
Perform Automatic Calibration procedure described as follows if one or more of the following components are replaced. Check and adjust CO2% value as indicated in the Combustion Table.
Components replaced:
- Primary heat exchanger
- Fan
- Gas valve
- Gas nozzle
- Burner
- Flame sensing electrode

11.14 Automatic Calibration Function
Before performing this function verify there are no heat demands in progress.
During this function ensure there is maximum heat exchange to the system in Heating or DHW mode (DHW request) to avoid boiler shutting off due to overheating.
Press \( \text{ boiler } \) and \( \text{ DHW } \) together and hold for about 6 seconds. When display indicates "On" press \( \text{ DHW } \) within 3 seconds after pressing previous buttons.

**NOTICE**

**Important:** If display indicates "303" Automatic Calibration function has not been activated. Disconnect boiler from main power supply for few seconds and repeat procedure.

1. When function is enabled, \( \text{ boiler } \) and \( \text{ DHW } \) will flash on the display.
2. After ignition sequence, which can also take place after few attempts, boiler performs three operations. Each operation lasts about 1 minute:
   - maximum power
   - ignition power
   - minimum power
3. Before moving to the following phase, from maximum power to ignition power and then to minimum power. \( \text{ boiler } \) and \( \text{ DHW } \) appear on the display.
4. During this phase, power level reached by boiler and delivery temperature alternate on the display.
5. When \( \text{ boiler } \) and \( \text{ DHW } \) flash together on the display, calibration function has terminated.
6. Press \( \text{ boiler } \) to exit the function. Display will show ESC.

**NOTICE**

**Important:** If Calibration function does not complete the function, press \( \text{ boiler } \) button to exit and decrease Maximum fan speed (parameter P71) before performing function again.

</table>

To **RESET**, press the **O/R** button for at least 2 seconds. For other error codes not described in table please contact manufacturer at 1(800) 325-5479.
• **APPLIANCE** - Device to convert gas into energy; term includes any component, control, wiring, piping or tubing required to be part of the device.

• **ANSI** - American National Standards Institute, Inc. oversees creation and maintenance of voluntary consensus standards, including ANSI Z21.13/CSA 4.9: Gas-Fired Low Pressure Steam and Hot Water Boilers.

• **ASME** - Association of Mechanical Engineers
  Establishes rules of safety governing the design, fabrication, and inspection of boilers and pressure vessels, determining the MAWP of such vessels.

• **ASTM** - American Society for Testing and Materials. ASTM International is one of the largest voluntary standards development organizations in the world trusted source for technical standards for materials, products, systems, and services. Known for their high technical quality and market relevancy, ASTM International standards have an important role in information infrastructure that guides design, manufacturing and trade in the global economy.

• **AUTHORITY HAVING JURISDICTION** - Individual or organization adopting and enforcing codes, rules, and by-laws governing various concerns of community. Commonly referred to as “final authority” for any matters relating to LIFE SAFETY and BUILDING CONSTRUCTION within a community.

• **BOILER** - Appliance intended to supply hot liquid for space-heating, processing or power purposes.

• **BTU** - Abbreviation for British Thermal Unit. Quantity of heat required to raise temperature of 1 pound of water 1°F.

• **BURNER** - Device for final conveyance of gas or mixture of gas and air, to combustion zone.

• **CALIBRATE** - Make fine adjustments or divide into marked intervals for optimal measuring.

• **COAXIAL VENTING** - Sharing the same center.

• **COMBUSTION** - Rapid oxidation of fuel gases accompanied by production of heat or heat and light. Complete combustion of fuel is possible only in presence of adequate supply of Oxygen.

• **COMBUSTIBLE MATERIAL** - Materials made of or surfaced with wood, compressed paper, plant fibers, or other materials capable of being ignited and burned. Such material shall be considered combustible even though flame-proofed, fire-retardant treated, or plastered.

• **COMBUSTION AIR** - Air that is drawn into an appliance to mix with fuel and support combustion.

• **CONDENSATE** - Liquid separated from flue gas due to reduction in temperature.

• **DIRECT VENT BOILER** - Boiler constructed and installed so all combustion air is derived directly from outdoors and all vent gases are discharged to outdoors.

• **DOMESTIC** - Relating to household usage as opposed to commercial usage.

• **DOMESTIC WATER** - Potable drinking water - tap water.

• **DRAFT** - Pressure difference causes gases or air to flow through a chimney, vent, flue or appliance.

• **FLA** - Full load amps.

• **FLUE** - Enclosed passageway for conveying combustion gases.

• **FLUE GASES** - Products of combustion plus excess air in appliance flues or heat exchanger.

• **GAS SUPPLIER** - Party that sells commodity of Natural Gas (Gas A) or LPG (Gas E).

• **HIGH-VOLTAGE** - Circuit involving potential of not more than 600 volts and having circuit characteristics in excess of those of low-voltage circuit.

• **HYSTERESIS (DIFFERENTIAL)** - Difference between the temperature at which the thermostat switches off - and the temperature at which it switches on again.

• **IGNITER** - Device utilizing electrical energy to ignite gas at main burner.

• **LEAK CHECK** - Operation performed on gas piping system to verify system does not leak.

• **LICENSED QUALIFIED INSTALLER / SERVICE TECHNICIAN** - Any individual, firm, corporation or company that either directly or through a representative is engaged in the installation, replacement, repair or servicing of gas piping, venting systems, appliances, components, accessories, or equipment, and whose representative is experienced and trained, in such work and has complied with the requirements of the authority having jurisdiction.

• **LOW WATER CUTOFF** - Device constructed to automatically cut off fuel supply when surface of water in boiler falls to lowest safe water level.

• **LOW-VOLTAGE** - Circuit involving potential of not more than 30 volts.
• **METRIC GAS METERS**

  **Natural Gas**

  \[
  \text{MBH} = \frac{127,116 \times \text{cu meters}}{\text{Seconds}}
  \]

  For example: Gas Meter measures 0.1 cubic Meters in 100 seconds

  \[
  \text{MBH} = \frac{127,116 \times 0.1}{100} = 127 \text{ MBH}
  \]

  **Propane Gas (LP)**

  \[
  \text{MBH} = \frac{383,482 \times \text{cu meters}}{\text{Seconds}}
  \]

• **NATIONAL BOARD OF BOILER AND PRESSURE VESSEL INSPECTORS** - Group composed of boiler and pressure vessel inspectors representing states, cities and provinces enforcing pressure equipment laws and regulations.

• **PRESSURE TEST** - Operation performed to verify gas tight integrity of gas piping following its installation or modification.

• **PURGE** - To free gas conduit of air or gas, or mixture of gas and air.

• **PURGE TIME** - Period of time intended to allow for dissipation of any unburned gas or residual products of combustion.

• **QUALIFIED AGENCY** - Any individual, firm, corporation, or company engaged in and responsible for:

  • Installation, testing, or replacement of gas piping, or connection, installation, testing, repair or servicing of appliances and equipment.
  • Experienced in such work.
  • Familiar with all precautions required.
  • Complies with all requirements of authority having jurisdiction.

• **SAFETY RELIEF VALVE** - Valve designed to relieve pressure in hot water supply system when pressure exceeds pressure capability of equipment.

• **SAFETY SHUTOFF DEVICE** - Device that will shut off gas supply to controlled burner in event source of ignition fails.

• **SEDIMENT TRAP** - Gas piping arrangement designed to collect any liquid or solid contaminant before reaching gas valve.

• **SERVICE** - Supply, installation, or maintenance of goods carried out by a Qualified Installer / Service Technician.

• **TWO PIPE SYSTEM** - Type of venting that allows for exhaust flue and intake air piping to be separated from each other. Fresh air may be drawn in at a different area from where flue terminal is located.

• **VENT** - Passageway used to convey flue gases from appliance vent connector to outdoors.

• **VENTING SYSTEM** - Continuous open passageway from of appliance vent connector to outdoors for purpose of removing flue or vent gases.

IMPORTANT

In accordance with Section 325 (f) (3) of the Energy Policy and Conservation Act, this boiler is equipped with a feature that saves energy by reducing the boiler water temperature as the heating load decreases. This feature is equipped with an override which is provided primarily to permit the use of an external energy management system that serves the same function.

THIS OVERRIDE MUST NOT BE USED UNLESS AT LEAST ONE OF THE FOLLOWING CONDITIONS IS TRUE:

- An external energy management system is installed that reduces the boiler water temperature as the heating load decreases.
- This boiler is not used for any space heating
- This boiler is part of a modular or multiple boiler system having a total input of 300,000 BTU/hr or greater.
- This boiler is equipped with a tankless coil.
APPLICATION GUIDE
FOR USE WITH

HEATING ONLY - 125, 165 &
COMBI - 150, 205

This manual has been prepared for use with the appropriate Installation, Operation and Maintenance Manual.

1. **General**
Boiler installation shall be completed by qualified agency. See Installation, Operation & Maintenance Manual for additional information.

![WARNING]
Fire, explosion, asphyxiation and electrical shock hazard. Improper installation could result in death or serious injury. Read this manual and understand all requirements before beginning installation.

2. **Become familiar with symbols identifying potential hazards.**

This is the safety alert symbol. Symbol alerts you to potential personal injury hazards. Obey all safety messages following this symbol to avoid possible injury or death.

![DANGER]
Indicates a hazardous situation which, if not avoided, **WILL** result in death or serious injury.

![WARNING]
Indicates a hazardous situation which, if not avoided, **could** result in death or serious injury.

![CAUTION]
Indicates a hazardous situation which, if not avoided, **could** result in minor or moderate injury.

3. **Installation shall conform to requirements of authority having jurisdiction or in absence of such requirements:**
- **United States**
  - National Electrical Code, NFPA 70.
- **Canada**
  - Natural Gas and Propane Installation Code, CAN/CSA B149.1.
  - Canadian Electrical Code, Part I, Safety Standard for Electrical Installations, CSA C22.1

4. **Where required by authority having jurisdiction, installation shall conform to Standard for Controls and Safety Devices for Automatically Fired Boilers, ANSI/ASME CSD-1.**
Additional manual reset low water cutoff or high limit may be required.

5. **Requirements for Commonwealth of Massachusetts:**
Boiler installation must conform to Commonwealth of Massachusetts code 248 CMR which includes but is not limited to:
- Installation by licensed plumber or gas fitter.

PN 240011430 REV H, [07/31/18]
GENERAL INFORMATION - HYDRONIC PIPING

**WARNING**

Burn and scald hazard! Manufacturer requires installation of field supplied anti-scald valve. Failure to follow these instructions could result in death or serious injury.

**General Information:**
Piping installation, materials, and joining methods shall conform to requirements of authority having jurisdiction or in absence of such requirements:

- **USA** - National Fuel Gas Code, ANSI Z223.1/NFPA 54
- **Canada** - Natural Gas and Propane Installation Code, CAN/CSA B149.1

**Manufacturer Requirements/Recommendations:**

- Manufacturer requires all domestic hot water (DHW) installations use an anti-scald valve. Local codes may require additional equipment (expansion tank, relief valves, etc.) Select and size equipment to suit installation and meet code requirements.

- Use of a water filter on incoming water supply line.

- Manufacturer recommends use of a magnetic dirt separator in the hydronic system where there are cast iron or steel components, or where the previous boiler was a cast iron heat exchanger. The abrasive, extremely fine sediment is difficult to remove and can deposit onto heat exchanger surfaces and accumulate in pump cavities causing reduced efficiency and premature wear.

- If the piping manifold is not used the ASME temperature and pressure relief valve and temperature and pressure gauge shall be installed to conform to requirements of the authority having jurisdiction. Refer to appropriate manufacturer instructions for installation requirements.

- If the piping manifold is not used, a primary / secondary piping arrangement is manufacturer recommended. A maximum of 12" of separation between the supply and return pipe (closely spaced tees) of the boiler shall be maintained.

- Limit combined supply and return pipe lengths to maximum linear lengths of 20 ft (6.1 m) between boiler and closely spaced tees, when minimum ¾” NPT pipe size is used. Linear length may be increased if supply and return pipe size is increased to limit pressure drop.

**FOR YOUR SAFETY READ BEFORE OPERATING**

**DANGER**

Hot Water Can Scald!
Water heated to temperature for clothes washing, dish washing and other sanitizing needs can scald and cause permanent injury. Children, elderly, and infirm or physically handicapped persons are more likely to be permanently injured by hot water. Never leave them unattended in bathtub or shower. Never allow small children to use a hot water tap or draw their own bath.

If anyone using hot water in the building fits the above description, or if state laws or local codes require certain water temperatures at hot water taps, you must take special precautions:

- Use lowest possible temperature setting.
- Install some type of tempering device, such as an automatic mixing valve, at hot water tap or water heater. Automatic mixing valve must be selected and installed according to manufacturer's recommendations and instructions.
- Water passing out of drain valves may be extremely hot. To avoid injury:
  - Make sure all connections are tight.
  - Direct water flow away from any person.
Provided Wiring and Piping illustrations are meant to show system concepts only. Installer is responsible for all equipment required by authority having jurisdiction.

Note: Arrange piping to prevent water dripping onto boiler.

All piping diagrams are shown with optional DHW Indirect Tank where applicable.

Use of Indirect Storage Tank (DHW):

Note: Sensors supplied with this boiler are proprietary to the manufacturer. Use of alternate sensors WILL diminish boiler performance.

- Use either DHW sensor or Indirect Tank Thermostat to interface with boiler. Wire to M2 terminals #9 and #10.
- Use of booster pump to increase flow rate to indirect tank is not recommended by manufacturer.
- Locate tank as close to boiler as possible.
- Size DHW tank, piping, and system to use only internal boiler pump.
- See available pump/flow rate chart, page 35 of this manual.
- Change P03 on boiler for application as specified on the wire diagram and Boiler Control section of Installation, Operation & Maintenance Manual supplied with the boiler.

The Labor Saver Piping Manifold, which is supplied with each boiler, is shown with most of the following piping diagrams.
Electrical Wiring Information:

All field wiring shall conform to the authority having jurisdiction or, in the absence of such requirements to:

- **USA:** National Electrical Code, ANSI/NFPA 70,
- **Canada:** Canadian Electrical Code, Part I, CSA C22.1: Safety Standard for Electrical Installations.

Wiring diagrams shown in this manual utilize the ARGO™ Universal Control, the optional use of an Indirect Domestic Hot Water Tank, and optional use of a H2O Buffer Tank.

Reference the zone control manufacturer instruction manual for control operation and priority setting of DHW zones.

**Note**

**DO NOT** use 120 V thermostat terminals (m1- #1 and #2).

**Note**

Provided Wiring and Piping illustrations are meant to show system concepts only. Installer is responsible for all equipment required by authority having jurisdiction.

Low Mass Piping

When installing low mass systems, additional water mass may be required to avoid short cycling by the boiler. In these applications it is recommended that a buffer tank be installed.

**Note:**
- DHW piping not shown for clarity. Reference applicable sections of this manual for DHW piping details.
- Internal Boiler circulator used on Primary circuit.

**Buffer Tank on Central Heat Circuit**

**Diagram:**

Low Mass Boiler Wiring with Buffer Tank

Connect the buffer tank aquastat to terminals 6 and 7 on terminal block M2.

System wiring remains as shown in the previous wiring diagrams.
Optional Equipment

**IMPORTANT:** Sensors supplied with this boiler are proprietary to the manufacturer. Use of alternate market sensors WILL diminish boiler performance.

1. **1k Ω** Outdoor Air Sensor, if used.
   A. Boiler automatically recognizes sensor when used.
   B. See Chart 1 for sensor data. Sensor part number BD710487302V
   C. Locate outdoor sensor to protect against wind and direct sunlight. Mounting instructions provided with sensor.
   D. Maximum wire length is 100 ft (30m) for 22 ga. wire, or 150 ft (45m) for 18 ga. wire.
   E. Connect wires to M2 OUTDOOR SENSOR terminals 4 & 5. Wires are interchangeable. See Accessories.

2. **10k Ω** Sensor for Indirect DHW Tank (Heating Only Boiler).
   A. See Chart 2 for sensor data.
      See Accessories section of this manual for wiring diagram.

Accessories:
1. 1k Ω Outdoor Temperature Sensor Kit - BD710487302V

Use Outdoor Sensor Kit with Heating Only or Combi Boilers. Wire Control to boiler M2 terminal strip terminals #4 and #5 as shown below.
Install/locate Control according to instructions supplied with sensor kit and Installation, Operation and Maintenance Manual (IOM).

Setting "Kt" Climate Curve:
Start boiler in CH mode. Depress CH control button once.

Boiler control will recognize installed OAS sensor. Display will change to show current default "Kt" value. Note display value.

When operation in CH mode, Kt value setting will override maximum CH boiler control set point based on current outdoor temperature.
- Refer to applicable °F (or °C) chart,
- Identify Kt range that will satisfy the desired boiler delivery temperature based on average (extreme) outdoor temperature range expected for climate location.

For temperatures below -40°F (-40°C), maximum heating flow temperature set point no longer increases and curves on the graph become horizontal.

Note

• Use lower value of range as the desired Kt value.
  (example): to deliver 186°F water @ OT of -20°F = Kt range is 90 thru 25. Select 25.
• To change "default" Kt value on boiler control use +/- CH Heating buttons.

When scolling has stopped, boiler will automatically “SAVE” value as new Kt default value and automatically return to CH mode when no Kt adjustment activity is sensed. Kt values can be changed in +/- 1 point increments.

To return to check or change current Kt “default value - depress one of the CH setpoint adjustment buttons (once), while in any heating or standby mode. Adjust Kt value to obtain desired comfort level.
2. **10k Ω Indirect Storage Tank Sensor Kit**

Heating Only boiler can be electrically connected to Indirect Storage Tank.

Diagram of hydraulic connection of external indirect storage tank is shown below.

Connect DHW priority sensor to terminals #9 and #10 on terminal block M2. The element of the sensor must be inserted in the sensor well located on the indirect storage tank.

Verify the exchange capacity of the storage boiler coil is appropriate for power of the boiler. Adjust DHW temperature (+95°F...+140°F / +35°C...+60°C) by pressing buttons on boiler control panel.

---

**Note**

Parameter PO3 for **Heating Only** boiler, with no indirect tank remains Factory Set at 08. No change is required.

If adding an Indirect Tank with a sensor to **Heating Only Boiler** - change PO3 parameter from 08 to 05.

If adding an Indirect Tank with a thermostat to **Heating Only Boiler** - change PO3 parameter from 08 to 04.

See Section 9, Parameter Settings, in boiler’s Installation, Operation, and Maintenance Manual.

Parameter PO3 for **COMBI** boiler factory set at 00 requires no change.

**Notes:**

- 176 °F Boiler Supply Water Temperature
- AHRI Rating Conditions - 50 °F Inlet Water
- @ 4.0 GPM FLOW RATE

Boiler output over 100,000 BTU does not effect tank performance.
Low Water Cut Off - Heating Only and Combi Boilers

These guidelines are supplied when necessary to install an additional Low Water Cut Off (LWCO), for sensing a low water level condition in a boiler, as required by the Authority Having Jurisdiction.

Follow LWCO manufacturer installation instructions for type of LWCO selected in addition to these instructions.

LWCO shall be 120V/60HZ control and dry contacts sized for load being connected. Wire control to boiler. See Figure 1.

Connect LWCO device to the system ground. Ground in accordance with the requirements of the authority having jurisdiction or, in the absence of such requirements, with the National Electrical Code (NEC) or Canadian Electrical Code CEC.

- Locate LWCO sensing device in the supply piping, above the minimum height of boiler. See Figure A-2, Piping Diagram.
- Position control in HORIZONTAL piping to assure proper boiler protection (upright or 90° rotation).
- For proper operation, sensing element of the LWCO control shall be positioned in the tee to sense the main water stream. Maintain minimum 1/4” spacing from pipe walls. Element shall NOT contact the rear, or side walls of the tee. See Figure A-3.
- Install an air vent using a tee to avoid nuisance shutdowns.
- Apply small amount of pipe sealant to threaded connections.
- Arrange piping to prevent water dripping onto boiler.
- DO NOT install water shutoff valve between boiler and LWCO sensing device.

LWCO Wiring Diagram
Piping Diagram - LWCO Location

Low Water Cutoff (LWCO) (See Figure 3 for detail)

- Air Vent
- Supply
- Position LWCO Above Top of Boiler
- Safety Relief Valve
- 5 gpm Limiter Factory Installed 205 Only
- Purge Valve
- Magnetic Dirt Separator
- Return

Notes:
- Arrange piping to prevent water dripping onto boiler.
- Illustrations are meant to show system piping concept only. Installer is responsible for all equipment and detailing required by authority having jurisdiction.
- DO NOT PLACE ISOLATION VALVE BEFORE TEE OR LWCO.
- Note: *Check Local Codes for Maximum Distance to Floor.
- Note: *To Drain

PN 240011430 REV H, [07/31/18]
Low Water Cutoff - Detail

NO

NO

NO

YES
De-Aeration Function

- When power is supplied to the boiler for the first time  will be displayed. If  is shown, press  for at least 2 seconds  will now be displayed.
- Press  together and hold for at least 6 seconds. The “De-Aeration” Function will be activated & ”On” showing.
- The boiler pump will run for up to 10 minutes. For 3-way valve models the valve will switch between heating & hot water. This will purge air from the system. The display will show 3 12

Gas Type Check

- Once de-aeration is complete on first fire-up the boiler will light and operates for 6 or 7 minutes to automatically check the gas type Gas A (Natural Gas “NG”) or Gas E (Liquefied Petroleum Gas “LPG”). The boiler software check the combustion value against the set value.
- On a Gas A (Natural Gas) supply the display shows  for at least 10 seconds and the boiler is ready for the normal operation. If the display shows  press  together and hold for at least 4 seconds to exit the function without saving.
- On a Gas E (LPG) supply the display show  press  for at least 6 seconds to confirm that this is the intended gas type for the installation.
- If the display shows  press  together and hold for at least 4 seconds to exit the function without saving then modify P02=01 as described in the Manual Instructions for the Installer section “PARAMETERS SETTING”.
- While the gas type is being identified, the boiler may be noisy.

IF THE BOILER IS TO BE OPERATED ON GAS E (LP) REPLACE THE EXISTING LABEL WITH THE GAS E LABEL SUPPLIED WITH THIS INSTRUCTION. ASSURE FACTORY SUPPLIED CONVERSION LABEL IS APPLIED TO PRODUCT IF CONVERTING TO LP.

IMPORTANT : Lors du démarrage de cette nouvelle chaudière veuillez appeler recueil International, Inc. de support technique pour l'assistance à l'installation et l'enregistrement.

Support technique et enregistrement du produit
lundi - vendredi 8h00 à 18h00 heure de l’Est.
1.800.253.7900

Ci-après la procédure d'activation de la Fonction Désaération/Identification Type de Gaz lorsque la chaudière est raccordée pour la première fois à la réseau électrique et les actions à mettre en œuvre en cas d'alimentation avec du gaz propane.

Fonction Désaération
- Lorsque la chaudière est raccordée pour la première fois à la réseau électrique l'afficheur indique 000. Si est affiché, appuyer pendant au moins 2 secondes sur la touche ; l'afficheur montrera alors le symbole 000.
- Appuyer simultanément sur les touches P et pendant au moins 6 secondes. La fonction « Désaération » est alors activée et l'indication « On » apparaît sur l'afficheur.
- La pompe de la chaudière se met en marche pendant environ 10 minutes. Pour les modèles à production instantanée d'eau chaude, la vanne à 3 voies effectuera la commutation entre les fonctions chauffage et eau chaude sanitaire, ainsi que la purge de l'air présent dans l'installation. L'afficheur indique 3 12.

Identification du type de gaz
- Quand la désaération est terminée la chaudière se mise en marche pendant environ 6-7 minutes pour vérifier automatiquement le type de gaz utilisé nG Gaz A (gaz naturel) ou Gaz E LPG (gaz liquide).
- Le logiciel de la chaudière compare la valeur de combustion avec la valeur prédéfinie. L'afficheur montre 000, en alternance avec la valeur en % de la puissance d'allumage et la valeur de la température °F (°C) de départ du chauffage.
- Si la chaudière est alimentée au Gaz A (gaz naturel), l'afficheur indiquera n 3 pendant environ 10 secondes. La chaudière est donc prête à fonctionner normalement. Si l'afficheur montre LPGappuyer simultanément sur les touches et pendant au moins 4 secondes pour quitter sans modifier le réglage d'usine.
- Si la chaudière est alimentée au Gaz E LPG (gaz liquide), l'afficheur montrera LPG. Appuyer pendant au moins 6 secondes sur la touche pour valider le type de gaz effectivement utilisé.
- Si l'afficheur indique n car le gaz d'alimentation n'est pas reconnu, appuyer simultanément sur les touches et pendant au moins 4 secondes pour quitter la fonction, puis modifier le paramètre P02=01 comme cela est décrit dans le manuel d'utilisation pour l'installateur dans «CONFIGURATION PARAMÈTRES" de la chaudière.
- Pendant le phase d'identification du type de gaz la chaudière peut être bruyante.

Si la chaudière est exploité à GAS E (LP) remplacer l'étiquette existante avec le gaz E ÉTIQUETTE FOURNIE AVEC CETTE NOTICE. Assurer la conversion de la configuration usine étiquette est appliquée au produit SI LA CONVERSION DE LP.
# Required Inspection Schedule

**To Be Completed By**
Qualified Service Technician

* Continue inspections beyond 4th year. Maintenance should continue annually for the life of the boiler to ensure safe worry free operation.
