1. Safety Information

Boiler installation shall be completed by qualified agency. See glossary for additional information.

**CAUTION**
Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

**WARNING**
Indicates a hazardous situation which, if not avoided, could result in death or serious injury. Read this manual and understand all requirements before beginning installation.

Become familiar with symbols identifying potential hazards.

This is the safety alert symbol. Symbol alerts you to potential personal injury hazards. Obey all safety messages following this symbol to avoid possible injury or death.

**WARNING**
Fire, explosion, asphyxiation and electrical shock hazard. Improper installation could result in death or serious injury. Read this manual and understand all requirements before beginning installation.

**DANGER**
Indicates a hazardous situation which, if not avoided, WILL result in death or serious injury.

**WARNING**
Indicates a hazardous situation which, if not avoided, could result in death or serious injury.

**CAUTION**
Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

**WARNING**
Do not tamper with or use this boiler for any purpose other than its intended use. Failure to follow these instructions could result in death or serious injury. Use only manufacturer recommended parts and accessories.

**CAUTION**
Laceration, burn hazard. Metal edges and parts may have sharp edges and/or may be hot. Use appropriate personal protection equipment to include safety glasses and gloves when installing or servicing this boiler. Failure to follow these instructions could result in minor or moderate injury.

**Note**
Used to address practices not related to personal injury.
2 - Introduction

2.1 Installation shall conform to requirements of authority having jurisdiction or in absence of such requirements:
- **United States**
  - National Electrical Code, NFPA 70.

2.2 Where required by authority having jurisdiction, installation shall conform to Standard for Controls and Safety Devices for Automatically Fired Boilers, ANSI/ASME CSD-1. Additional manual reset low water cutoff may be required.

2.3 Requirements for Commonwealth of Massachusetts:
Boiler installation must conform to Commonwealth of Massachusetts code 248 CMR which includes but is not limited to:
  - Installation by licensed plumber or gas fitter.

2.4 Manufacturer recommends use of Carbon Monoxide monitor may be requirement of local jurisdiction.

2.5 Designated Use
- Hot water heating boiler.
- Indoor installation.
- Closet or alcove installation.
- Direct vent boiler or single vent pipe.
- For use with natural gas or liquefied petroleum gases (LP/propane).

2.6 The unit MUST NOT:
- Directly heat potable water. Indirect heating is acceptable.
- Heat water with non-hydronic heating system chemicals present (example, swimming pool water).
- Exceed 50 psig (3.44 bar) maximum allowable working pressure, or drop below minimum system pressure 7.25 psig (.50 bar)
- Exceed 176°F (80°C) system design temperature.

2.7 Operational Features
- Modulating: 15-100% Input Rate.
- Integral Dual Limit.
- Integral Low Water Pressure Cutoff.
- Outdoor Temperature Reset.
- Heat exchanger over heat protection.
- Recommended system pressure (cold) 21.7 psig (1.5 bar)
3 - COMPONENT LISTING

DMG-240

1. Condensate trap
2. Gas Valve
3. Fan
4. Air/gas Mixer
5. Heat exchanger
6. Burner sight glass
7. Manual air vent
8. Flue sensor
9. Coaxial flue connector
10. Exhaust test port
11. Intake test port
12. Exchanger flange high limit (#4 on wire diagram)
13. Ignition/Flame detection electrode
14. Spark generator
15. Automatic air vent
16. Auxiliary control board box
17. Air/gas venturi
18. Pump
19. Boiler drain
21. Low water pressure switch
22. Thermal fuse (#6 on wire diagram)

A. Condensate trap drain
B. Gas inlet connection
C. Heating supply connection
D. Heating return connection
4.1 Boiler Location Considerations

- Ambient room temperature always above 32°F (0°C) to prevent freezing of liquid condensate.
- Approved for installation in closets or alcove provided it is correctly designed for that purpose.
- Not approved for outdoor installation.
- Protect gas ignition system components from water (dripping, spraying, rain, etc.) during operation and service (circulator replacement, condensate trap, control replacement, etc.).
- Access to outdoors to meet minimum and maximum pipe lengths for combustion air and vent piping. See section 6.
- Disposal of condensate. See section 6.
- Drainage of water (or water - antifreeze solution) during boiler service or from safety relief valve discharge. See section 5.
- Access to system water piping, gas supply, and electrical service. See sections 5, 7 and 8.
- Clearances to combustible materials and service clearances. See Table 2 and figures 4-1a - 4-2c.
- Boiler shall be installed on flat vertical wall which is capable of supporting the weight of the boiler.
- Boiler may be installed in any room or internal space, special attention shall be given to the requirements of the current electrical provisions with respect to the installation of the boiler in a room or internal space containing a bath or shower. Where a room-sealed boiler is installed in a room containing a bath or shower, it must not be possible for a person using the bath or shower to touch any electrical switch or boiler control utilizing line voltage electricity.
- Multiple Boilers can be wall mounted, placed side by side, or back to back.

(1) Required distances measured from boiler jacket.
(2) Service, proper operation clearance recommendation.
* Allowance for piping at the bottom of boiler not included.

**WARNING**

Fire Hazard! Do not install on carpeting. Failure to follow these instructions could result in death or serious injury.
4 - LOCATING BOILER

**FIGURE 4-1a** Clearance to Combustible Materials

**FIGURE 4-1b** Clearance to Combustible Materials

**FIGURE 4-2a** Service Clearances - Boiler Front

**FIGURE 4-2b** Service Clearances - Boiler Left side

**FIGURE 4-2c** Service Clearances - Closet Installation

CLEARANCES REQUIRED FOR CLOSET INSTALLATION

0 in / 0 mm between the Back of the Unit and the wall
CAUTION

Boiler weight exceeds 140 pounds (63.5 kg). Do not lift boiler onto wall without assistance.

**Note**
Lift boiler using chassis. Using front jacket, vent piping, water or gas fittings to lift boiler may cause damage to the boiler.

**Note**
Use two (2) wrenches when tightening and fitting to pipe boiler's threaded fittings. Boiler's internal piping can be damaged if subjected to excessive torque.

4.2 Wall Mounting

Pre-pipe supply and return water connections with factory fittings before wall mounting.

Mount boiler on wall using wall mounting bracket included with unit.
- Verify boiler is level and upright. Mark position of holes for plumbing connections.
- If rear exit flue is used, mark position of hole for flue.
- For horizontally terminating units continue to mark the horizontal center line of flue across the wall to the side wall, then along side wall ensuring the lines have a downward pitch back to the boiler. This will give the position of the center of the hole for the flue.
- Cut 5-5/16” (135.00 mm) diameter hole in the wall for concentric flue
- Lift boiler and hang it on wall.
- Adjust the position of the boiler verify it is level.

For Direct Vent installations, air vents are not required in the room boiler is installed in, or when installed in closet or compartment.
5 - HYDRONIC PIPING

5.1 General

- Primary/Secondary piping required.
- Install piping in accordance with authority having jurisdiction.
- Support system piping and safety relief valve discharge piping. Boiler’s internal piping and wall mount bracket can be damaged if subjected to excessive weight.
- Size central heating pump (and domestic hot water pump, if used) for system requirements only. Internal heat exchanger pump compensates for pressure drop through boiler internal piping and heat exchanger.
- Thoroughly clean and flush system before connecting to boiler.
- If oil is present in system water, use approved detergent to wash system.
- It is necessary to semi-annually check the water quality of central heating systems.
- Flush system to remove any solid objects such as metal chips, fibers, or Teflon tape, etc.
- Use purge valve to flush zoned systems, each zone separately. If purge valves and isolation valves are not installed, install them to properly clean the system.
- When purging installations that include standing iron radiators and systems with manual vents at high points, start with nearest manual air vent. Open the vent until water flows out, then close vent. Repeat this procedure, working toward furthest air vent.
- Install a basket strainer if large amounts of sediment is present. Keep basket clear of sediment build up.
- Flare system until water runs clean and piping is free of sediment.
- Manufacturer recommends a water treatment product be used for sediment removal.

5.2 Special Conditions

- System piping exposed to freezing conditions: Use inhibited propylene glycol solutions certified by fluid manufacturer for use with closed water heating system. Do not use automotive or ethylene glycol.
- Boiler installed above radiation level (or as required by authority having jurisdiction). Integral low water pressure switch is provided in boiler.
- Boiler used in connection with refrigeration system. Install piping in parallel with boiler, with appropriate valves to prevent chilled medium from entering boiler.
- System piping connected to heating coils located in air handling unit exposed to refrigerated air circulation. Install flow control valves or other automatic means to prevent gravity circulation of boiler water during cooling cycle.
5 - HYDRONIC PIPING

5.3 Safety Relief Valve and Air Vent

- Install safety relief valve using pipe fitting provided with boiler. See figure 5-1.
- Install safety relief valve with spindle in vertical position.
- Do not install shutoff valve between boiler and safety relief valve.
- Install discharge piping from safety relief valve.
- Use ¾" or larger pipe.
- Use pipe suitable for temperatures of 375°F (191°C) or greater.
- Individual boiler discharge piping shall be independent of other discharge piping.
- Size and arrange discharge piping to avoid reducing safety relief valve relieving capacity below minimum relief valve capacity stated on rating plate.
- Run pipe as short and straight as possible to location protecting user from scalding and properly drain piping.
- Install union, if used, close to safety relief valve outlet.
- Install elbow(s), if used, close to safety relief valve outlet and downstream of union (if used).
- Terminate pipe with plain end (not threaded).

5.4 Low Water Cutoff

- Boiler is equipped with Low Water Pressure Switch.
- Low Water Cutoff (LWCO) probe location. See figure 5-3 for minimum probe height. Do not install shutoff valve between boiler and LWCO probe.
- If using separate stand pipe, install air vent using tee to avoid nuisance shutdowns.
- Arrange piping to prevent water dripping onto boiler.
- Connect probe signal wires to shutdown terminal (BL) on control board.
5.5 Trim Piping

- Temperature - Pressure Gauge. Install temperature pressure gauge using piping provided with boiler. See figure 5-1. If using optional floor mount pedestal install as close to boiler supply fitting as practical and visible.
- Boiler has integral drain valve located inside jacket directly underneath pump. Install provided external drain valve.

5.6 System Piping

- See Table 4 for basic system piping configurations.
- Systems with automatic fill valves require back flow prevention device.
- Single boiler system. See figures 5-4, 5-5, for general guidance. Additional considerations:
  - Boiler control is designed for single central heating pump. Installer responsible for integration of multiple central heating pumps.
  - Boiler control allows domestic hot water prioritization. Function could be lost if central heating pump not directly connected to control system.
- Multiple boiler system. See figures 5-6, 5-7, and 5-8 for general guidance. Additional considerations:
  - Control system requires equivalent water temperatures entering each boiler to properly sequence and adjust system supply temperature.

⚠ WARNING

Burn and scald hazard. Verify all plastic caps are removed from boiler connections. Failure to follow these instructions could result in death or serious injury.

- Thoroughly flush all hydronic piping.
- Secure all valves/fittings to boiler.
- Ensure washers supplied are utilized.
- Face valves and fittings to rear wall.
- Fit union bends to valves.
  A. If soldering to boiler union bends, ensure bends are not connected to the valves, otherwise internal seals may be damaged.
  B. Verify 3/4" [22.2 mm] isolating valve with filter is fitted to heating return connection.
  C. Fit pressure relief valve connection vertically before heating isolating valve.
- Connect system valve pipe work to the boiler.
WARNING
Burn and scald hazard. Safety relief valve could discharge steam or hot water during operation. Install discharge piping per these instructions.

- Route pressure relief valve discharge piping to the floor. Follow local code with respect to necessary distance to the floor. See Figure 5-1.
- Verify all valves are closed.
- Connect supplied condensate trap to a drain. Verify there is continuous slope towards the drain, avoid level horizontal sections of tubing.

5.7 Heating System And Refrigeration
Boiler when used in connection with refrigeration system, must be installed so chilled medium is piped in parallel with the boiler with appropriate valves to prevent chilled medium from entering the boiler.

Boiler piping system of hot water boiler connected to heating coils located in air handling units where they may be exposed to refrigerated air circulation must be equipped with flow control valves or other automatic means to prevent gravity circulation of the boiler water during the cooling cycle.
Illustrations are meant to show system piping concept only. Installer responsible for all equipment and detailing required by authority having jurisdiction.

*Note*

12" (305mm) Maximum Separation

**Note**
6.1 General

- Installations shall comply with Authority having jurisdiction and in absence of such with:
  - U.S. ANSI Z223.1 /NFPA 54 in the United States
  - CSA B149.1 in Canada.
- This boiler requires a dedicated direct vent system or may be category IV Indoor air.
- Vent connections serving appliances vented by natural draft shall not be connected into any portion of mechanical draft systems operating under positive pressure.
- Materials used in the U.S. shall comply with Authority having jurisdiction and in absence of such with: ANSI/ASTM D1785, ANSI/ASTM F441, ANSI/ASTF493, UL1738 or UL5636.
- Canadian installations only: All venting material, primer and glue must be listed to ULC S636.
- Canadian installations only: First 3 ft. (0.9m) of plastic vent pipe from vent connector must be readily accessible for visual inspection.

- Support piping in accordance with pipe manufacturer’s instruction and authority having jurisdiction. In absence of manufacturer’s instruction use pipe hooks, pipe straps, brackets, or hangers of adequate and strength located at intervals of 4 ft (1.2m) or less. Allow for expansion/contraction of pipe.

6.2 Removal of Existing Boiler From Common Vent System

When existing boiler is removed from common venting system, common venting system is likely to be too large for proper venting of appliances remaining connected to it. After removal of existing boiler, following steps shall be followed with each appliance remaining connected to common venting system placed in operation, while other appliances remaining connected to common venting system are not in operation:

- Seal any unused openings in common venting system.
- Visually inspect venting system for proper size and horizontal pitch. Determine there is no blockage or restrictions, leakage, corrosion and other deficiencies which could cause an unsafe condition.
- When practical, close all building doors, windows, and all doors between space in which appliances remaining connected to common venting system are located and other spaces of building. Turn on clothes dryer and any appliance not connected to common venting system. Turn on exhaust fans, such as range hoods and bathroom exhaust so they will operate at maximum speed. Do not operate summer exhaust fan. Close fireplace dampers.
- Turn on appliance being inspected. Follow lighting instructions. Adjust thermostat so appliances will operate continuously.
- Test for spillage at draft hood relief opening after 5 minutes of main burner operation. Use flame of match or candle, smoke from cigarette, cigar or pipe.
- Determine each appliance remaining connected to common venting system properly vents when tested as outlined above. Then return doors, windows, exhaust fans and any other gas-burning appliance to their previous condition of use.
- Any improper operation of common venting system should be corrected so installation conforms with National Fuel Code, ANSI Z223.1/NFPA 54 and/or Natural Gas and Propane Installation Code, CAN/CSA B149.1. When re-sizing any portion of common venting system, common venting system should be re-sized to approach minimum size as determined using appropriate tables in Chapter 13 of the National Fuel Gas Code, ANSI Z223.1/NFPA 54 and/or Natural Gas and Propane Installation Code, CAN/CSA B149.1.

WARNING
Fire, explosion, and asphyxiation hazard. Improper installation could result in death or serious injury. Read these instructions and understand all requirements before beginning installation.

WARNING
Cascade venting of condensing boilers shall be vented with manufacturer's polypropylene venting material. Failure to follow these instructions could result in death or serious injury.

WARNING
ABS/PVC venting shall not to be used this product. Use of DWV plumbing pipes to vent this boiler shall be prohibited. Use of cellular core PVC (ASTM F891), cellular core CPVC, or Radel® (polypheolsulfone) in venting systems shall be prohibited. Covering non-metallic vent pipe and fittings with thermal insulation shall be prohibited. Failure to follow these instructions could result in death or serious injury.

Note
Follow venting manufacturer’s equivalent lengths for specialty fittings.
6 - COMBUSTION AIR AND VENT PIPING

**6.3 Approved Venting Materials**

Installation shall conform to requirements of authority having jurisdiction or in absence of such requirements:

**A. Vent Material Options:**

1. 80 mm / 125 mm Polypropylene concentric ("4 inch / 2 inch")

   *Note* Follow venting manufacturer's equivalent lengths for specialty fittings.

2. 80 mm polypropylene twin pipe (MUST be polypropylene on BOTH intake and exhaust) ("3 inch")

   or

3. 3" Twin pipe CPVC (PVC optional on intake ONLY).

**B. Approved Polypropylene Manufacturers:**

Must comply with UL 1738 or ULC S636. The following manufacturers have been evaluated:

- Natalini
- Duravent
- Centrotherm
- Z Flex

**C. Vent Termination**

- Terminate combustion air and vent pipes with fittings or concentric vent kit.
  - Use horizontal pipe for vent and 90° elbow for combustion air termination when using fittings.
  - Separate vent terminal from air inlet terminal to prevent flue gas recirculation. If T-Terminal is used on flue pipe at sidewall, air inlet terminal shall be at least 36" or more away from vent terminal.
  - Locate combustion air termination as far as possible from swimming pool, swimming pool pump house, and other sources of airborne chlorine.
  - Locate combustion air and vent terminals as required by authority having jurisdiction.

**6.4 Concentric Venting Instructions**

**A. General**

- Examine all components for possible shipping damage,
### WARNING

- Covering non-metallic vent pipe and fittings with thermal insulation shall be prohibited.
- Use of cellular core PVC for venting flue gas could result in death, or serious injury.
- Concentric venting shall be fastened with screws. Dual flue venting is NOT fastened with screws.

prior to installation.
- Venting system must be free to expand and contract.
- Support venting system in accordance with these instructions.
- Vent system must have unrestricted movement through walls, ceilings and roof penetrations.
- Check for proper joint construction when joining pipe to fittings.
- If vent is penetrating ceilings and floors, openings must have means of firestopping in joist areas and proper firestop spacer assemblies installed.
- Standard roof flashing methods must be employed to install roof flashing.
- Wall and roof openings must be framed to provide support attachment of termination assemblies.
- Slope vent pipes minimum 3/4" (2 cm/m) for every 3 ½ ft (1.0 m) back toward boiler. Support horizontal sections to prevent sags capable of accumulating condensate.

For horizontal flues a minor deviation from the horizontal is allowable, provided it results in a downward slope towards the boiler. For the vertical flue termination, refer to the separate installation instructions supplied with the assembly.

- Use of additional flue components as follows:

<table>
<thead>
<tr>
<th>Elbow</th>
<th>Total Length Reduction</th>
</tr>
</thead>
<tbody>
<tr>
<td>45°</td>
<td>1' 8&quot; (0.5 m)</td>
</tr>
<tr>
<td>90°</td>
<td>3' 4&quot; (1.0 m)</td>
</tr>
</tbody>
</table>

Total flue length shall not exceed 21 ft (6.4 m) to include allowance for elbows.
- Connect flue elbow to top of boiler and adjust direction of elbow to desired orientation (rear, right or left).
- Measure distance from outside wall face to elbow. This dimension will be known as ‘X’. add distance “Y” + 2” (50 mm) to “X” this is the total dimension of the vents.
- Mark dimension from above on outer aluminum intake vent. Measure length of waste material, and transfer dimension to inner grey flue pipe.
- Remove waste from both vents (flue and air). Verify cut ends are square and free from burrs. Insert flue back into intake air vent and pass them through hole in wall.
Check all measurements before cutting. Clearance to combustible materials is zero when using concentric vent system.

After installing venting use calibrated analyzer to verify there is no recirculation of combustion.

Ensure minimum downward slope of 2 in (50mm) for every 3 ft (1.0m) of flue length toward the boiler.

Ensure termination is positioned with slots at the bottom.

B. Concentric Vent Support

All venting must be supported every 4 ft (1.3 m) using steel strapping or equivalent. See Figure 6-4.

C. Flue Options

Standard horizontal termination is suitable only for horizontal applications.

Maximum permissible equivalent flue lengths are:

Concentric venting = 21 ft (6.4 m)

Any "in line" elbows in flue system must be taken into consideration.

<table>
<thead>
<tr>
<th>Elbow</th>
<th>Total Length Reduction</th>
</tr>
</thead>
<tbody>
<tr>
<td>45°</td>
<td>1' 8&quot; (0.5 m)</td>
</tr>
<tr>
<td>90°</td>
<td>3' 4&quot; (1.0 m)</td>
</tr>
</tbody>
</table>

The first elbow in horizontal run is NOT included in any equivalent length calculations

Illustrations show examples of maximum equivalent lengths. See Figure 6-5.

D. Concentric Vent Screw Placement - See Figure 6.7

Fasten two screws through outer intake pipe behind the gaskets at equal distances approx. 180° apart.
Note - screws used must be no larger than No.8 - 1/2" sheet metal screws and must be zinc coated. Length of this screw must be 0.75 in (19.00 mm).

When connecting vent pipes use only a small amount of silicone grease supplied with the exhaust pipes. Do not use other types of grease.

6.5 Two Pipe Polypropylene System
Two pipe venting allows for exhaust flue and intake flue to be separated from each other. Fresh air may be drawn in at a

different area from where the flue terminal is located.
Splitting kit consists of adaptor and of intake air vent adaptor.
See Figure 6-8.
Use screws and seals removed from the cap for the air duct adaptor.
90° elbow allows boiler to connect to the venting termination
gardless of direction since it can be rotated 360°. It can also
be used to connect the vent with 45° elbow.

### A. Separated Horizontal Flue Termination Installation

**Options: See Figure 6-9**

Maximum length of intake vent (L1) shall not exceed 49 ft
(15.00 m) -

\[
(L1 + L2)_{max} = 100 \text{ ft (30 m)}
\]

### B. Spring Clamp Instructions - See Figure 6-11

Manufacturer recommends use of a spring clamp at every
push-fit gasket connection when using a polypropylene vent.

**Note** Ensure minimum downward slope of 2 in (50 mm)
for every 4 ft (1 m) of duct length toward boiler.

**Note** If using indoor air for combustion do not exceed
100ft (30m) exhaust vent pipe.

### FIGURE 6-8 - Two Pipe Polypropylene System Adapter

</table>
Follow vent manufacturer instructions or, if unavailable, below when installing spring clamps:

- Take dual flue spring clamp with larger hole in it and place it onto male end of pipe.
- Slide clamp all the way down the pipe with smaller opening of clamp towards female end of the pipe.
- Bend clamp over the female end of pipe "A" and slide male end of pipe "B" through clamp and into female end of pipe "A".

*Note* This clamp is necessary for the dual flue pipe. Dual flue spring clamp is for indoor use only and should not be used in outdoor applications.

C. Two Pipe Vent Support - See Figure 6-12

All venting must be supported every 4' (1m) using steel strapping or equivalent.

Slope vent towards boiler approximately 3/4" (2 cm) for every 3' (1.0 m)

Equivalent Length of Dual Flue Elbows:

6.6 Venting Configurations
Various venting configurations can be applied to this boiler. For guidance see Venting Configuration Table 5A and corresponding figures.

Use of vent covers may cause freezing. If using vent covers overall vent length must be considered. Failure to heed this information may compromise operation of this boiler.

Side Wall Terminations

- 12" (305mm) Min. horizontal separation between combustion air intake and vent of same appliance.
- 12" (205mm) Min. horizontal separation between combustion air intake and vent of different appliances.
- 15" (381mm) Max. horizontal length of vent.
- Min. vent/intake between different appliances 12" (305mm).
- Max. allowable total vertical vent length with outside exposure is 10 ft. (3.05m).
- Abandoned unused masonry chimney may be used as chaseway for combustion air and vent. Both combustion air and vent pipe must exit above top of chimney with clearances as shown in figure 6-14.

Roof Terminations

- 3" (76mm) Min. 24" (610mm) Max. Separation horizontal separation between combustion air intake and vent terminations.
- 12" (305mm) Min. vertical separation between combustion air intake and vent terminations.
- 12" (305mm) min. 24" (610mm) Max. separation between bottom of combustion air intake and vent.
- Multiple terminations as shown in 6-1, and 6-3 must be a min. of 12" (305mm) horizontally between vent of one termination and air intake of next appliance. Manufacturer recommends greater separation.
- Max. allowable total outside exposure vent length equals 10 ft. (3.05m).
- Maintain a pitch of 1/2" per ft. (42mm/m) outside exposure back to boiler to ensure proper condensate drainage for horizontal runs.

Grade, Snow & Ice

Maintain 12"(305mm) US (18"(457mm) Canada) clearance above highest anticipated snow level 24" (610mm) above roof or ground.

Avoid locations where snow may drift and block vent and combustion air. Ice or snow may cause boiler to shut down if vent or combustion air becomes obstructed.

Doors & Windows

Combustion air and vent termination must be 12" (305mm) from or below doors, windows or gravity inlet.
12" (305mm) Min.
Separation of Combustion Air and Vent shall be maintained.
No Maximum separation is required when using T-Terminal for vent.

Note
Configurations of single pipe vent with flue on the sidewall, requires a tee as the vent terminal. See figures 6-17, 6-19 and 6-21

Note
If separation in Fig. 6-15 is not large enough to prevent cross flow contamination between flue gas and fresh air use T-Terminal as shown in Fig. 6-17. Use of T-Terminal for vent as shown in Fig. 6-17 does not have a max. separation requirement between flue gas and fresh air.

NOTICE

Configurations of single pipe vent with flue on sidewall, requires tee as vent terminal. See figures 6-21 and 6-23.
6.7 Side Venting Terminal Requirements of:

<table>
<thead>
<tr>
<th>Venting terminal from doors and windows</th>
<th>See figure 6-22</th>
</tr>
</thead>
<tbody>
<tr>
<td>Venting terminal from forced air inlet of other appliances</td>
<td>See figure 6-23</td>
</tr>
<tr>
<td>Venting terminal from snow level</td>
<td>See figure 6-24</td>
</tr>
<tr>
<td>Venting terminal from vegetation</td>
<td>See figure 6-25</td>
</tr>
<tr>
<td>Venting terminal from public walkway</td>
<td>See figure 6-26</td>
</tr>
</tbody>
</table>

**FIGURE 6-22**

- Termination must be min. 12" (305mm) from or below doors, windows or gravity inlet. If boiler uses inside air min. 4' (1219 mm).

**Doors & Windows**

- Combustion air and vent termination must be min. 12" (305mm) from or below doors, windows or gravity inlet. If boiler uses inside air min. 4' (1219 mm).

**Condensate**

- Vent gas may condense, forming moisture, may be corrosive. Protect building materials at vent from exhaust of vent gas.

**FIGURE 6-23**

- Forced Air Inlet

- Terminate venting system minimum 3' (914mm) above and 10' (3.0m) from any forced air inlet (except boiler’s combustion air inlet).

**FIGURE 6-24**

- Grade, Snow & Ice

- Maintain 12"(305mm) US, 18"(457mm) Canada clearance above highest anticipated snow level, 24" (610mm) above roof.

- Avoid locations where snow may drift and block vent and combustion air. Ice or snow may cause boiler to shut down if vent or combustion air becomes obstructed.

- "L" Corner

- Vent termination shall NOT be installed closer than 3' (914mm) from inside corner of "L" shaped structure.
FIGURE 6-25

Vegetation, Plants & Shrubs
Keep vent termination 3’ minimum (914mm) away from vegetation. Position termination where vent vapors will not damage plants/shrubs or air conditioning equipment.

Meters, Regulators, deck, porch
Vent termination US only - 4’ (1.2m), Canada - 6’ (1.9m) horizontally from, no case above or below, electric meters, gas meters, regulators, and relief equipment, or under deck or porch.

FIGURE 6-26

Walkways
Locate vent termination minimum 7’ (2.1m) above any public walkway, with consideration to condensate.

People or Pets
Locate combustion air and vent termination to prevent accidental contact with people or pets.

Stones, Balls, Etc.
Position combustion air and vent termination where it will NOT be damaged by foreign objects, such as stones, balls, etc.

Vapors
Position termination where vent vapors are not objectionable.

Eddy, Flue Gases
Position termination so it will not be effected by wind eddy, air born leaves, snow, or recirculated vent gases. Give consideration to excessive wind and locate away from windward side of building.

Multiple Family Dwellings
Vent shall not terminate directly above paved sidewalk or paved driveway located between two single-family dwellings serving both dwellings.

</tr>
</tbody>
</table>

* For clearances not specified in ANSI Z223.1/NFPA 54 or CSA B149.1, clearance will be in accordance with local installation codes and requirements of gas supplier and these installation instructions.

(1) Vent shall not terminate directly above sidewalk or paved driveway located between two single family dwellings and serves both dwellings.

(2) Permitted only if veranda, porch, deck or balcony is fully open on a minimum of one side beneath the floor.

---

Note: Local Codes or Regulations may require different clearances. Flue termination must be exposed to external air and position must allow free passage of air across it at all times. In certain weather conditions termination may emit a plume of steam. Avoid positioning termination where this may cause nuisance.
6.8 Condensate Piping

- Use materials acceptable to authority having jurisdiction. In absence of such authority:
  - USA - PVC or CPVC per ASTM D1785/D2845 Cement or primer per ASME D2564 or F493.
  - Canada - CSA or ULC certified PVC/CPVC pipe, fittings and cement.
- Connect condensate hose, hose clamps, and coupling to boiler drain trap as shown in figure 6-28.
- Connect condensate piping to 3/4" NPT coupling as shown.
- Slope condensate drain pipe minimum 1/4" per foot (21mm/m) away from boiler.
- Use field source condensate pump if boiler located below disposal point.
- Field source condensate neutralizing kit as required by authority having jurisdiction or for environmentally friendly condensate disposal.
6.9 Multiple Boiler Venting - General

- For common exhaust system DuraVent® is the approved vent manufacturer - DuraVent® - Concentric only.
- See Figures 6-35, 6-36 and 6-37. Termination must be vertical through the roof. Sidewall horizontal terminal not allowed.
- Ensure minimum downward slope of 2 in (50.00 mm) for every 3 ft 4 in (1.00 m) of duct length toward boiler.
- Manufacturer recommends use of CO monitor, calibrate regularly per CO monitor manufacturer instructions.
- Place pipes at least 1 in (30 mm) from heat sources.
- Keep area clean and free of debris.
- Use only water (H₂O) as lubricant when inserting pipes together. Do NOT use any type of grease or similar substances.
- Do NOT use screws to secure pipes together.
- Before securing pipe with clamps, verify pipe is inserted into gasket between 1/32 in and 15/32 in (8.0-15 mm).
- Install steel strapping (A) of pipe (B) distance of 10 in (250.0 mm) from boiler.
- Secure flue pipe to wall with supports 4 ft. (1 meter) from each other. Secure supports along the joint of each pipe.

6.10 Multiple Boiler Venting - Mounting Procedure - See Figures 6-29 thru 6-33

1. Vent pipes correctly mounted. See Figure 6-29.
2. Line horizontal common vent pipes with male end towards condensate collector end cap.
3. Fully insert male end of horizontal common vent pipe into bell end of another horizontal common vent pipe. Mark horizontal common vent pipe male end once fully inserted. Pull horizontal common vent pipe back 1/32 in. to 19/32 in. from full insertion.
4. Hang horizontal common vent pipe, do not fully tighten clamps down.
5. Connect end cap and condensate trap to horizontal common vent pipe. See Figure 6-31.
6. Connect 90° elbows to horizontal common vent pipe for each boiler in cascade system
7. Connect flue damper to 90° elbow for each boiler in cascade system.

**WARNING**
Asphyxiation hazard. DO NOT use screws to secure piping together. Failure to follow these instructions could cause death or serious injury.
8. Connect boiler flue adapter to flue damper for each boiler in cascade system. Ensure flue adapters allow for 3° or 2 in. per 3 ft. slope of horizontal collectors back towards condensate collector.

9. Connect intake air screen to flue adapter for each boiler in cascade system. Combustion air shall come from indoors only.

10. Connect cascade vent system to flue connection on top of boilers.

11. Connect end cap and condensate trap to horizontal common vent pipe.

12. Secure flue adapters using approved clamps to wall. Ensure clamps are connected minimum of 10 in. from top of boiler. See Figure 6-32.

13. Secure approved clamp around flue adapter. Ensure clamp is locked in to proper position. See Figure 6-32.
   A. Position 1 - Clamping around bell end of adapter.
   B. Position 2 - Clamping around flue pipe adapter.

14. Maximum distance between supports for horizontal pipes 3 ft 4 in. Maximum distance between supports for vertical pipes 6 ft 7 in. See Figure 6-33.

15. Fully tighten horizontal common vent pipe supports.

FIGURE 6-32 Secure Clamp around Flue Adapter

</tbody>
</table>

Flue header size shall be calculated by qualified service agency during system design as required by local authority having jurisdiction.
7.1 General

- Use piping materials and joining methods acceptable to authority having jurisdiction. In absence of such requirements:
  - USA - National Fuel Gas Code, ANSI Z223.1/NFPA 54
  - Size and install gas piping system to provide sufficient gas supply to meet maximum input at not less than minimum supply pressure. DMG-240 requires a gas rate of 242.59 ft³/h (6.87 m³/h) for Natural Gas (Gas A) and 95.04 ft³/h (2.69 m³/h) for Liquid Propane Gas (Gas E).
  - Gas meter and supply pipes must be capable of delivering the listed quantity of gas in addition to demand from any other appliances in the house. DMG-240 requires a 3/4” (19.5 mm) gas supply pipe.
  - Support piping with hooks, straps, bands, brackets, hangers, or building structure components to prevent or dampen excessive vibrations and prevent strain on gas connection. Boiler will not support piping weight.
  - Use thread (joint) compound (pipe dope) suitable for liquefied petroleum gas.
  - Install external field sourced manual main gas shutoff valve, ground joint union, and sediment trap upstream of gas valve. See figures 7-2 and 7-3.
  - Leak test boiler and gas line connections before placing boiler into operation.

CAUTION

WHAT TO DO IF YOU SMELL GAS

- Do not try to light any appliance.
- Do not touch any electrical switch; do not use any phone in your building.
- Immediately call your gas supplier from a neighbor’s phone. Follow gas supplier’s instructions.
- If you cannot reach your gas supplier, call the fire department.

7.2 LP Conversion

- See conversion instructions included with LP Conversion Kit. Purchased Separately.

<table>
<thead>
<tr>

</tr>
<tr>
<td>5.0</td>
<td>13.5</td>
</tr>
</tbody>
</table>

Note

Use two (2) wrenches when tightening and fitting to pipe boiler’s threaded fittings. Boiler’s internal piping can be damaged if subjected to excessive torque.
7.3 Leak Check Gas Piping
Pressure test boiler and gas connection before placing boiler in operation.

- Pressure test over 1/2 psig (3.5 kPa). Disconnect boiler and its individual gas shutoff valve from gas supply system.

- Pressure test at 1/2 psig (3.5 kPa) or less. Isolate boiler from gas supply system by closing manual gas shutoff valve. See figure 7-3.

- Locate leakage using gas detector, noncorrosive detection fluid, or other leak detection method acceptable to authority having jurisdiction. Do not use matches, candles, open flames, or other methods that can provide ignition source.

- Correct leaks immediately and retest.
8.1 General
Electrically bond boiler to ground in accordance with requirements of authority having jurisdiction. Refer to:
- USA - National Electrical Code, ANSI/NFPA 70.

8.2 Electric Knockouts (Figure 8-1)
- Eight knockouts located on bottom of chassis.
  A. Thermostat (Section 8-10)
  B. Outdoor Reset (Section 8-9)
  C. Frost Protections ( Section 8-12)
  D. DHW Sensor (Sections 8-11, 8-13)
  E. Release Input (Section 8-7)
  F. Shutdown Input (Section 8-15)
  G. Analog Input (Section 8-8, IF-01 board)
  H. Analog Output (Section 8-8, IF-01 board)
  I. Alarm (IF02 or SCU-S02 board)
  J. External Heat System Pump (Section 8-8, SCU-S02 board)
  K. DHW Diverter/Pump (Section 8-8)
  L. External Gas Shutoff (Section 8-8)
  M. Minimum Gas Pressure Switch (Section 8-8)
  N. Solar Input (Section 8-8)

8.3 Electrical Connections
- Boiler requires 120V 60Hz power supply. Verify electrical supply is polarized.
- Boiler shall be grounded and on dedicated circuit.
- Shall be one common isolator, providing electrical isolation for boiler and any external controls. Using PVC insulated cable 18 AWGx3C 221°F / 105 °C.
- All wiring must be installed in accordance with requirements of the National Electrical Code and any additional national, state, or local code requirements having jurisdiction. All wiring must be N.E.C. Class 1.
- Canada, installation must conform to CSA C22.1 Canadian Electrical Code Part 1 and any local codes.
- If replacing original boiler wiring use only TEW 105°C or equivalent.

WARNING
Electrical shock hazard. Turn OFF electrical power supply at service panel before making electrical connections. Failure to do so could result in death or serious injury.

Note
Wiring diagrams can be found in Section 14 of this Manual.

FIGURE 8-1 Electric Knockouts Bottom Of Boiler
8.4 Access To Connection Block
1. Unscrew two screws located under front panel a quarter turn. Remove panel.
2. Guide controller or thermostat wire through round grommet(s) on right side of boiler's bottom plate right.
3. Tilt control box forward by opening holding clips located on each side of boiler.
4. Open control panel cabinet by unfastening clip on front of control box. Push lip back for latch.
5. Run wire(s) through grommet(s) in control panel cabinet.
6. Unscrew wire clamp (to access connection block) and bring wires through.
7. Connect wires to appropriate terminals on connection block.
8. Firmly tighten wire clamps and close control panel cabinet.

Various thermostats and controllers can be connected to standard control PCB (X12 connection block).

8.5 Main Supply Connection
Main supply is connected to terminal block X1 which is high voltage (120V / 60Hz).
8.6 Shutdown Input
- Boiler has a shutdown input, input is on BL terminals of control board.
- Only suitable for potential free contacts.
- When using this input remove jumper cable.
- Change input setting using P36. See parameter Settings page 61.

8.7 Release Input
- Boiler has release input, input is on RL terminals of connector.
- Change input setting using P37. See parameter Settings page 61.
- Only suitable for potential free contacts.

8.8 Optional Electrical Connections:

Auxiliary Control Box
Control PCBs are located in auxiliary control box. See instructions provided with control PCB.
- Unclip PCB cover
- Remove cover

Connection Options for 0-10V Control PCB (IF-01)
IF-01 control PCB is built into auxiliary control box. Refer to instructions supplied with product.
Do not connect freeze thermostat or room thermostat to boiler if using 0-10 V control PCB.

1. **Connection Status (Nc)** - If boiler locks out, a relay is de-energized and an alarm can be transmitted via a dry set of contacts (maximum 120 VAC-1A) on terminals Nc and C of the control board connection.

2. **Connection Status (OTm)** - Interface communicates with boiler control using Open Therm protocol. OTm connection must be connected to Open Therm input OT of boiler control.

3. **Analogue Input (0-10V)** - Control can be based on temperature or heat output. Two controls are described below. Analog control, 0-10 V signal must be connected to the interface.
4. **Analog Temperature-Based Control - 0 - 10 V**

Signal controls boiler supply temperature between 32°F (0°C) and 194°F (90°C). Control modulates on basis of supply temperature, heat output varies between minimum and maximum values based on supply temperature set point calculated by the controller. Jumper 2 on the interface is used to select either temperature control (%)/ or heat output control (%).

<table>
<thead>
<tr>
<th>Jumper 2</th>
<th>Input Signal (V)</th>
<th>Temperature (°F/°C)</th>

</tr>
<tr>
<td></td>
<td>1.8 - 10.0</td>
<td>64.4-176.0 (18.0-80.0)</td>
<td>Temperature required</td>
</tr>
</tbody>
</table>

5. **Analog Heat Output - Based Control - 0-10V**

Signal controls boiler output between 0% and 100%. Minimum and maximum values are limited. Minimum output is linked to boiler's modulation depth. Output varies between minimum and maximum value on basis of value determined by controller.

<table>

\(^i\) Dependent on minimum modulation depth (set speeds, standard 20%)
Connection Option For PCB (SCU-S02)
If boiler is fitted with control PCB (SCUS02) it will automatically be recognized by the automatic boiler control.

If removing this PCB boiler will show fault code E38. To prevent this fault, auto-detect must be done after removing the PCB. See Auto-Detect.

LED status indicator D3 top right of control PCB indicates status:
- Continuous signal: PCB working normally.
- Flashing signal: No connection.
- No signal: No voltage or faulty PCB (Check wiring).

1. Heating System External Pump Control - External pump for heating system can be connected to Pump terminals of control board. Maximum input power is 300 VA/ 0.4 FHP. Auxiliary relay must be used for pump with larger input.

2. External Three-Way Valve (3WV) Control - External three-way valve (120 VAC) can be used when connecting DHW indirectly water heater. Neutral position of three-way valve can be set using parameter P34. Three-way valve is connected as follows:
- N = neutral
- C = heating system
- D = indirect tank

If neutral position of three-way valve is adjusted with parameter P34 connect the pump as follows:
- N = N pump.
- C = L pump.
- Ground

3. External Gas Valve Control - If there is a call for heat, alternating voltage of 120 VAC, 1 A (maximum) becomes available on EgV terminals of control board to control an external gas valve.

4. Operation Signal And Failure Signal (EgV) - Alarm or operation signal is selected using parameter P40.
   - If boiler is operating, operation signal can be switched using dry set of contacts (maximum 120 VAC, 1 A) on NO and C terminals of the connection.
   - If boiler locks out, alarm can be transmitted using dry set of contacts (maximum 120 VAC, 1 A) on No and C terminals of connection.

5. Pressure Switch Minimum GPS - minimum gas pressure switch shuts boiler down if inlet gas pressure becomes too low. Connect minimum gas pressure switch to Gps terminals. Presence of gas pressure switch must be set using parameter P41.
8.9 Outdoor Temperature Sensor

- Supply temperature (maximum) - P1
- Supply temperature (minimum) - P25
- "WWSD" (Warm Weather Shutdown) - P26
- Outdoor temperature (default) - P27

If outdoor temperature sensor is connected, heating curve can be adjusted. Setting can be modified using parameters - P1, P25, P26, and P27.

- Outdoor Sensor, if used.
  A. Provided with boiler.
  B. Locate outdoor sensor to protect against wind and direct sunlight. Mounting instructions provided with sensor.
  C. Maximum wire length is 100 ft (30m) for 22 ga. wire, or 150 ft (45m) for 18 ga. wire.
  D. Connect wires to OUTDOOR SENSOR terminals. Wires are interchangeable.
  E. Outdoor temperature sensors are a boiler accessory. Where there is an on/off thermostat, boiler will control the temperature with set point of the internal heating curve.

8.10 Central Heating Thermostat

- If a room thermostat with an anticipator is used, parameter P5 must be adjusted.
- Install thermostat in frequently occupied room.
- Connect 2 wire dry contact room thermostat to ON/OFF-OT terminals of boiler’s control board connection. Note: ON/OFF-OT terminals are NOT able to supply 24V to the thermostat.
- Use thermostat or boiler system control with dry contacts related 0.5 amps @ 120 VAC. Boiler control does NOT provide 24 VAC power to central heating thermostat.
- Locate and install thermostat per manufacturer’s instructions. Maximum wire length is 330 ft (100m) for 22 ga. wire.
- Connect wires to on/off - OT terminals. Wires are interchangeable.
- Boiler is not suitable for Nest type thermostat without external AC power supply.

Use dry contact for wires to CH T-T terminal and DHW T-T terminal. E33 error code is displayed if voltage is sent back to the control board. If error is not corrected for extended period of time, this voltage can permanently damage control board.

If room thermostat with anticipator is used, parameter P must be adjusted.
8.11 DHW Indirect Water Heater
Connect DHW indirect tank sensor or thermostat (TS) to "T dhw" terminals on control board.

8.12 Frost Protection
Frost protection in combination with ON/Off thermostat.

- If ON/Off thermostat is used, protect any rooms where there is a risk of freezing by using freeze thermostat (FT). Radiator valves or zone where there is risk of freezing must be open.

- Connect frost thermostat in parallel with On/Off room thermostat (RT) to ON/Off_OT terminals of control board connection.

Frost protection in combination with outdoor temperature sensor.

- Heating system can be protected against freezing in combination with outdoor temperature sensor. Radiator valve or zone must be open where there is a risk of freezing.

- Connect outdoor temperature sensor to "T out" terminals of control board.

- Frost protection activates when outdoor temperature sensor reads a temperature lower than 10°F (-10°C). This can be adjusted using parameter P30. Circulation pump will switch on and operate continuously until the outdoor temperature increases past value set on parameter P30.
8 - ELECTRICAL CONNECTIONS

FIGURE 8-14 Example Of Hydronic Circuit With DHW Indirect Water Heater

- Connect Indirect tank sensor to $T_{dhw}$ terminals as described in section 8.11.
- Connect CH (Central Heating) pump on terminal N-L "Pump" of control PCB (SCU-02) see section 8.8.
- Connect DHW (Domestic Hot Water) pump on terminal N-D "3wV" of control PCB (SCU-02) see section 8.8.

FIGURE 8-15 Example Of System Shutdown Input Connection

Example below shows connection of shutdown input for system connecting to auxiliary board. See section 8.6.
9.1 Fill Condensate Trap with Water

**WARNING**

Asphyxiation hazard! Fill condensate trap before starting boiler to avoid combustion products escaping boiler. Failure to follow these instructions could result in death or serious injury.

- To fill the condensate trap pour water into exhaust vent until water begins to flow through the siphon.
- Visually inspect the siphon to ensure it is full with clean water.
- During operation check the condensate trap to ensure it draining properly.

**Note**

Condensate trap must be manually filled with water at initial start up.

9.2 Commission Setup (Water)

**Note**

To maintain boiler efficiency and prevent boiling inside the heat exchanger, flush entire heating system until clean.

- Check distribution system to ensure it is sized and installed correctly.
- Before filling, open all valves on the heating circuit in the installation.
- Flush heating system, including all heating zones.
- Fill boiler with potable water.
- Fill boiler and system piping with water (or antifreeze-water solution, if used). See antifreeze information page 11. Purge air from boiler using air vent. Purge air from system piping.
- Close air vent after all air is purged from both boiler and system piping.
- Inspect system piping and boiler connections. Repair any leaks immediately.
- Check water pressure gauge is between 14.7-22.1 psi (1-1.5 bar) when system water temperature is cold. If pressure is lower turn water off. Turn water on and restart the filling process very slowly to vent air. System must be turned not read pressure from display.
- Boiler is equipped with hydraulic pressure switch which prevents boiler from operating without water.
- Check there are no leaks from any water connections.
9.3 Commission Setup (Gas)

1. Check gas type supplied matches data shown on boiler's rating plate.
2. Check gas piping to ensure it is sized and installed correctly.
3. Visually inspect piping to determine there are no open fittings or ends, and all valves at unused outlets are closed and plugged/capped.
4. Purge air from piping. Confirm there is a steady gas supply to the boiler.
5. Open main gas supply.
6. Open gas shutoff valve on boiler.
7. Unscrew, quarter turn, two screws located under front panel, remove the panel.
8. Tilt control box forward by opening holding clips located on each side of the boiler.
9. Check gas supply pressure at pressure outlet "Pi" on gas valve unit.
10. Ensure all gas connections are tight.
11. Pressure test the gas line:
   A. Test pressure must not exceed 0.87 psig/60 mbar.
   B. Purge gas supply pipe within boiler by unscrewing pressure outlet on gas valve.
   C. Tighten the port when pipe has been sufficiently purged.
12. Check all gas connections in the boiler are tight.
13. Check piping and connections for leaks immediately after gas is turn on. Shut off gas supply and make necessary repairs if leaks are found.

9.4 Commission Setup (Electric)

1. Check electrical connections to thermostat and other external controls. Check any other connections to boiler.
2. Check all electrical connections, particularly the ground connection.
3. System test pumps - verify each pump is operational using vibration, noise and amp draw.
9.5 Control Panel

**Display**

1. [Escape] or RESET button
2. Heating Temperature or [-] button
3. DHW temperature or [+] button
4. [Enter] or cancel → lock-out button
5. Setup buttons (press the 2 and 3 buttons simultaneously)
6. [Menu] buttons (press the 4 and 5 buttons simultaneously)
7. ON/OFF switch

---

9.6 Deaeration Function

Control performs the Deaeration function at initial start and after a reset of a locking error and after power up.

Before starting boiler deaeration function **must** be performed.

Rotate black cap on deaerator, located inside the boiler, counter clockwise \( \odot \) to ensure aerator is open. See Figure 9-3.

- When power is supplied to the boiler Deaeration function starts.
- Display shows 17 (Deaeration) and water pressure (Psi). See Figure 9-4.
- Boiler pump will run on and off for up to 10 minutes. This will purge air from the system.
- The burner will switch on for a few seconds to verify increasing temperature on flow/return sensors.
- Boiler is ready to start in standard operation.

Repeat Deaeration function at least 3 times switching boiler on off using \( \odot \) button.

Manually operated purge valve can also be performed by using purging valve on top of the heat exchanger.
9.7 Commissioning

- Tilt control box upwards. Fasten with clips located at the sides.
- Open main gas supply.
- Open gas shutoff valve on boiler.
- Plug boiler into an electrical socket.
- Turn boiler on using ON/OFF switch.
- Set controls (thermostats, control system) to generate a call for heat.

**Start-up cycle begins, this cannot be interrupted.**
During start-up cycle, display shows following information:
A short test where all segments of the display are visible.

- **Fxx** : Software version
- **Pxx** : Parameter version. Version numbers are displayed alternately.
- Air purge cycle is automatically carried out for 3 minutes.

9.8 Before Gas Conversion
When converting from natural gas (A) to propane gas (E), before calibrating gas valve, replace venturi assembly (B) as indicated in figure 9-2.
Disconnect gas pipe (threaded nut "C") and remove three screws securing the flange.
Verify there are no gas leaks.

### Table: Venturi and Nozzle Specifications

</tr>
</tbody>
</table>

**FIGURE 9-6 Venturi and Nozzle**

9.9 Gas Conversion (Propane)
Boiler is preset to operate on natural gas (A).
For operation with propane gas, carry out following:

1. Activate "Calibration function" to set boiler to operate on full load and on part load in Heating mode.
2. Adjust Fan Speed as indicated in table found in section "Parameter Settings" (if required).
4. Set air/gas ratio (O\(_2\)/CO\(_2\), %): Full load and Part load as describe below.
5. Use combustion analyzer to properly set gas valve.
6. Allow time between adjustments for your combustion analyzer to sense adjusted CO\(_2\) /O\(_2\) level. This function is interrupted if the central heating supply temperature reaches its MAX. SETPOINT.

To measure combustion efficiency and emissions of products of combustion, boiler has two dedicated built in test ports.
One connection port is connected to exhaust flue (A), and allows monitoring of the quality of combustion products and combustion efficiency.
Other is connected to combustion air intake (B), used to check for recycling products for combustion.
The following can be measured at exhaust flue test port:
- temperature of combustion products
- oxygen (O\(_2\)) or carbon dioxide (CO\(_2\)) concentration;
- carbon monoxide (CO) concentration.
The temperature of combustion air must be measured on the air intake test port (B) by inserting the measurement sensor approximately 3-3/16" (80.00 mm) (C) for the DMG-240.

**FIGURE 9-7 Combustion Air Temperature Ports**
9.10 Combustion Setup (High-Fire)

- Unscrew exhaust port plug at exhaust flue test port.
- Insert combustion analyzer into exhaust flue test port. Verify the opening around combustion analyzer probe is completely sealed when taking measurements.
- Set boiler to high-fire by pressing two buttons simultaneously. Display will show H3 and the symbol will appear.
- Measure percentage of O₂ or CO₂ in flue gases.
- Compare the measured values with values in table below.
- Adjust gas/air ratio using high-fire adjustment screw (V) if needed. Turn screw clockwise to reduce CO₂ level and counterclockwise to increase it.

<table>
<thead>

</tbody>
</table>

* Installer's guide only. Use test port to verify safe CO levels with door installed before leaving job site.

9.11 Combustion Setup (Low-Fire)

- Unscrew exhaust port plug at exhaust flue test port.
- Insert combustion analyzer into exhaust flue test port. Verify the opening around combustion analyzer probe is completely sealed when taking measurements.
- Set boiler to low-fire by pressing two buttons simultaneously. If the boiler is already in combustion setup mode for high fire, press the (-) button several time until L3 is displayed on the screen.
- Measure percentage of O₂ or CO₂ in flue gases.
- Compare the measured values with values in table below. Remove front panel when comparing values.
- Adjust gas/air ratio using low-fire adjustment screw (K) if needed. Turn screw clockwise to increase CO₂ level and counterclockwise to decrease it.

9.12 Operational Check

- Inspect combustion air and vent piping. Verify pipe is not leaking and terminations are unobstructed. Verify vent gas discharge is not a nuisance or hazard.
- Verify boiler functions.
- Inspect condensate disposal system. Verify condensate flows adequately and is disposed properly.
- Check control module operation.
- Check field sourced limits, low water cutoffs, etc. per manufacturer's instructions.
9.13 User Level Parameters

Parameters \( P_1 \) to \( P_8 \) can be adjusted by end user to meet heating system and DHW comfort needs.

Modification of factory settings may be detrimental to operation of the boiler.

- Press the two Menu buttons simultaneously and then (+) button until symbol flashes on the menu bar.
- Select the user menu using button, \( P_1 \) button is displayed with "1" flashing.
- Press button a second time, the central heating supply temperature value appears and flashes, e.g. 170°F.
- Change the value by pressing (-) button or (+) button. In this example using (-) to (140°F).
- Confirm the value with button, \( P_1 \) is displayed with "1" flashing.
- Press button 2 times to return to current operating mode.

9.14 Installer Level Parameters

Parameters \( P_{17} \) to \( dF \) (error code history) must only be modified by a qualified installer.

To prevent unwanted settings, some parameter settings can only be changed after special access code \( 0012 \) is entered.

Modification of factory settings may be detrimental to operation of the boiler.

- Press the two Menu buttons simultaneously and then (+) button until symbol flashes on the menu bar.
- Select the INSTALLER menu using the button. "CODE" appears on the display.
- Use (-) or (+) button to input the installer code "0012".
- Confirm using button, "P1" is displayed with "1" flashing.
- Press button a second time, the value will appear and flashes, for example [80°C (176°F)].
- Change the value by pressing the [-] or [+] button. [In this example using [-] to change the value to 60 °C (140 °F).]
- Confirm the value with the button, “P1” is displayed with 1 flashing. Button, “P1” is displayed with 1 flashing. If necessary, set other parameters by selecting them using the (-) or (+) button.
- Press button 2 times to return to current operating mode.
9.15 Parameters Settings

Boiler control panel is set for most common heating systems. With these settings, most heating systems operate correctly; however, installer can adjust parameters according to their own preferences.

(1) Do not modify these factory settings unless absolutely necessary. E.g. to adapt the boiler to: Propane (gas E)

* Note: There are sea level values: please see Parameter Settings For High Altitude (section 2.2)
9.16 Reading Measured Values

The following current values can be read from the information menu.

- St = State
- Su = Sub-status
- t1 = Supply temperature °F/ºC
- t2 = Return temperature °F/ºC
- t3 = DHW tank temperature °F/ºC
- t4 = Outdoor temperature °F/ºC (Only with an outdoor temperature sensor: Optional)
- t5 = Solar boiler temperature °F/ºC
- t6 = Flue gas temperature °F/ºC
- Sp = Internal set point °F/ºC
- Fl = Ionization current (μA)
- nf = Fan speed in rpm
- Pr = Water pressure psig/bar
- Po = Supplied relative heat output (%).

Reading the Current Values

1. Press the two buttons simultaneously. The symbol flashes.
2. Confirm using button. t1 is displayed alternating with current status 3 (for example).
3. Press the button. t2 is displayed, alternating with the current sub-status (for example).
4. Press the button. is displayed, alternating with the current flow temperature (for example).
5. Press the button successively to scroll down to the various parameters.
6. Press the button. is displayed, alternating with the internal set point (for example).
7. Press the button. is displayed, alternating with the current ionization current (μA) (for example).
8. Press the button. is displayed, alternating with the current fan rotation speed rpm (for example).
9. Press the button. is displayed, alternating with the current water pressure bar (for example).
10. Press the button. is displayed, alternating with the current modulation percentage (%) (for example).
11. Press the button. The readout cycle starts again with t1.
12. Press the button 2 times to return to the current operating mode.
### 9.17 Status And Sub-Status

9.18 Return To The Factory Settings

- Press the two Menu buttons simultaneously and then (+) button until symbol flashes on the menu bar.
- Select the INSTALLER menu using "CODE" appears on the display.
- Use (−) or (+) button to input the installer code "0012".
- Confirm using button. P:1 is displayed with 1 flashing.
- Press the [+ ] button several times p:df is displayed with df flashing.
- Press button df:x is displayed with x flashing. This is the current value of X for dF. Check this against the value of X on the type plate.
- Enter the value of X shown on the type plate using the [-] or [+ ] button.
- Confirm the value with the button, df:y is displayed with y flashing. This is the current value of Y for dU. Verify the value of y on the rating plate is the same.
- Enter the value of y shown on the rating plate using the [-] or [+ ] button.
- Confirm the value with the button. The factory settings are reset.
- The display returns to the current operating mode.
FOR YOUR SAFETY READ BEFORE OPERATING

**WARNING**

*If you do not follow these instructions exactly, a fire or explosion may result causing property damage, personal injury or loss of life.*

- This appliance is equipped with an ignition device which automatically lights burner. **Do NOT try to light this burner by hand.**
- Before operating smell all around appliance area for gas. Be sure to smell next to floor because some gas is heavier than air and will settle to the floor.
- **Use only your hand to turn the gas shutoff valve.** Never use tools. If valve will not turn by hand, do not try to repair it, call a qualified service technician. Force or attempted repair may result in fire or explosion.
- **Do not use this appliance if any part has been under water.** Immediately call a qualified service technician to inspect appliance and to replace any part of control system and any gas control which has been under water.

---

**10.1 SEQUENCE OF OPERATION**

- With demand for heat, pump circulates water through primary circuit.
- Combustion fan will come on and begin to operate at ignition speed.
- Once fan reaches ignition speed, control board will allow power to flow to spark generator and gas valve creating ignition in combustion chamber. Flame sensor will acknowledge presence of flame in combustion chamber and send a signal to control board.
- Temperature sensor will send signal to control board allowing the control board to increase / decrease speed of the fan. The combustion fan will in turn modulate gas rate accordingly.
- Once central heating loop temperature exceeds central heating loop setpoint unit will shutdown and go through 3 minute time delay (burner pause time) before another call for heat.
- During this time the pump will run for additional three minutes to dissipate any residual heat.

---

**10.2 OPERATING INSTRUCTIONS**

*Stop! Read Safety information above.*

- **Set thermostat to lowest setting.**
- **Turn "OFF" all electrical power to appliance.**
- **This appliance is equipped with an ignition device which automatically lights the burner. Do not try to light burner by hand!**
- **Turn gas shutoff valve clockwise to closed position. Handle should be perpendicular to gas pipe.**
- **Wait 5 minutes for any gas to clear. Smell for gas, including near floor. If you smell gas, STOP! Follow instructions on this page: “What To Do If You Smell Gas.” If you do not smell gas, go to next step.**
- **Turn gas shutoff valve counter clockwise to the open position. Handle should be parallel to gas pipe.**
- **Turn "ON" electrical power to appliance.**
- **Set thermostat to desired setting.**
- **If the appliance will not operate, follow instructions TO TURN OFF GAS TO APPLIANCE and call your service technician or gas supplier.**

---

**CAUTION**

**WHAT TO DO IF YOU SMELL GAS**

- **Do not try to light any appliance.**
- **Do not touch any electrical switch; do not use any phone in your building.**
- **Immediately call your gas supplier from a neighbor’s phone. Follow the gas supplier’s instructions.**
- **If you cannot reach your gas supplier, call the fire department.**

---

**10.3 TO TURN OFF GAS TO APPLIANCE**

- **Set thermostat to lowest setting.**
- **Turn "OFF" all electric power to appliance if service is to be performed.**
- **Turn gas shutoff valve handle clockwise to closed position. Handle should be perpendicular to gas pipe.**
11 - GENERAL MAINTENANCE AND CLEANING

11.1 Beginning of Each Heating Season

- Check boiler area is free from combustible materials, gasoline, and other flammable vapors and liquids.

- Visually inspect combustion air and vent piping for proper operation. Check for and remove any obstruction to flow of combustion air or vent gases. Immediately repair or replace pipe showing deterioration or leakage. Reassemble per instructions in section 6. Ensure proper reassembly and resealing of system.

- Visually inspect condensate drain line for proper operation. Checking for deteriorated or plugged condensate drain line. Verify condensate trap drains freely and clean as required.

- Test safety relief valve for proper operation. Refer to valve manufacturer's instructions packaged with relief valve.

- Examine flue passages in heat exchanger, burner, condensate lines, and cleaning (if necessary) by following instructions in "Annual Examination and Cleaning of Boiler Components" in this section.

⚠️ DANGER

Before servicing, turn off electrical power to boiler at service switch. Close manual gas valve to turn gas supply OFF to boiler. Failure to comply will result in death or serious injury.

⚠️ CAUTION

Label all wires prior to disconnection when servicing controls. Wiring errors can cause improper and dangerous operation.

Verifying proper operation after servicing.

Perform regular service and maintenance by qualified service agency at least once every 12 months to assure safe, trouble free operation and maximum efficiency.
11 - GENERAL MAINTENANCE AND CLEANING

• Circulator pump and combustion air blower motor furnished with boiler are permanently lubricated from factory and require no further lubrication. Lubricate field sourced pumps and/or motors according to pump and/or motor manufacturer’s instruction.

• Check following components are operating properly and are free of blockages or obstructions:
  • air vent;
  • check venturi air inlet for blockage and clean as required;
  • verify pressure test port cap and combustion test port are in place;
  • return temperature sensor clip must be securely seated on pipe; Check boiler for any sign of leaks.
• Check low water cutoff using user interface (if installed).
  • Check operation by pressing test button on low water cutoff.
    • "Low Water" LED should illuminate and burner should shut down.
    • Should get error message on User Interface (E36).
  • Every 5 years remove low water cutoff. Reinstall after cleaning.
  • Every 10 years replace low water cutoff.
• See Table 13 page 41 for flame signal rate at 100% firing rate (High fire).
• Visual inspection of flame through sight glass. Burner should be fully illuminated. See figure 11-1.
• Check heating system expansion tank.

11.2 Annual Shut Down Procedure
• Follow instructions “To Turn Off Gas To Appliance” unless boiler is also used to supply domestic hot water. See section 10.
• Drain system completely if system does not have antifreeze when heating system is to remain out of service during freezing weather.
• Drain condensate lines when boiler is to be exposed to freezing temperatures.

WARNING
Following service procedures must be performed by qualified service agent. Boiler owner shall not attempt these steps. Failure to do so could result in death or serious injury.

11.3 Annual Inspection and Cleaning of Boiler Components
• Obtain Burner Inspection Kit. Follow heat exchanger cleaning kit instructions for examination and cleaning.
11 - GENERAL MAINTENANCE AND CLEANING

11.4 Maintenance And Routine Servicing

Check and service boiler as necessary. Frequency of servicing will depend upon installation conditions and usage, manufacturer recommends annually.

- Check flue termination outside verify it is not blocked.
- Operate boiler and verify operation of its controls and meets acceptable parameters.
- Ensure all system connections and fittings are tight and not leaking. Redo any joints and check the tightness of any fittings that may be leaking.
- Verify safety relief valve is in working order following its manufacturer's instructions.

To ensure boiler is operating at peak efficiency perform the following inspection:

- Check appearance and tightness of gas and combustion circuit gaskets
- Check condition and position of ignition/flame sensing electrode
- Check condition of burner and ensure it's secure to aluminum flange
- Check for any dirt in combustion chamber. Use vacuum-cleaner to clean combustion chamber.
- Check gas valve is calibrated correctly
- Check there is no dirt in condensate trap
- Check the central heating system pressure
- Check on expansion tank pressure
- Check vent system and clean it if necessary

Record details and maintain service history.

11.5 Component Replacement And Cleaning

1. Remove any deposits from heat exchanger using suitable soft brush. Do not use brush with metallic bristles.
2. Check condition of the combustion chamber insulation panels. Any damaged panels must be replaced.
3. Check condition of burner injector on the manifold, carefully clean it with a soft brush if necessary. Do not use a brush with metallic bristles this might damage the injector.
4. Remove any fallen deposits from bottom of inner case.
5. Clean burner with soft brush and check flame ports are clear. Blockages may be removed with stiffer brush.
6. Check condition of electrodes.
7. Check spark gap, positioning and height of electrodes.
8. Check fan impeller is clean and free to rotate.

Combustion chamber insulation in this product contains ceramic fiber material. Ceramic fibers can be converted to cristobalite in very high temperature applications. The International Agency for Research on Cancer (IARC) has concluded, Crystalline silica inhaled in the form of quartz or cristobalite from occupational sources is carcinogenic to humans (Group1). Avoid breathing dust and contact with skin and eyes. Use NIOSH certified dust respirator (N95). This type of respirator is based on the OSHA requirements for cristobalite at the time this document was written. Other types of respirators may be needed depending on the job site conditions. Current NIOSH recommendations can be found on the NIOSH website http://www.cdc.gov/niosh/homepage.html. NIOSH approved respirators, manufacturers, and phone numbers are also listed on this website. Wear long-sleeved, loose fitting clothing, gloves, and eye protection. Apply enough water to the combustion chamber lining to prevent dust. Wash potentially contaminated clothes separately from other clothing. Rinse clothes washer thoroughly.

Label all wires prior to disconnection when servicing controls. Wiring errors can cause improper and dangerous operation. Failure to follow these instructions could result in minor or moderate injury.
11.6 Draining the Boiler

- turn boiler off
- isolate electrical supply
- close boiler gas service cock
- allow boiler to cool
- drain boiler through onboard drain (item 19 page 7) or external drain valve.

Draining the Heating Circuit

- Follow all steps in 11.6.
- Close central heating flow and return valves.
- Connect suitable pipe to drain point.
- Route it to suitable container.
- Open drain tap.
12.1 Ratings and Capacities

- Constructed and hydrostatically tested for maximum allowable working pressure of 50 psig (pounds per square inch gauge) (115 kPa) in accordance with ASME Boiler and Pressure Vessel Code, Section IV, Rules for Construction of Heating Boilers.

- In USA, for elevations beyond 2,000-ft reduce input by 4% for each 1,000-ft above sea level in accordance with National Installation Code ANSI Z223.1

- In Canada, input rate is reduced by 10% for elevations 2,000-ft to 4,500-ft. Contact Provincial Authority having jurisdiction for Installations above 4500-ft (1350m) above sea level.

13 - TROUBLE SHOOTING

13.1 Troubleshooting
This boiler is fitted with an electronic regulation and control unit.

Control system is a microprocessor, Comfort Master®, which controls and protects the boiler. If a fault is detected anywhere in the boiler, boiler will lock out and display will show the fault code as follows:

- Red flashing display:
  - The symbol
  - The "RESET" symbol

Descriptions of each error code are given in the table below.

To reset an error code, press button for 2 seconds.

If the error code continues to display, search for the cause in error table and follow instructions given in solution section.

13.2 Shutdowns and Lock-outs

Blockage
If a blockage condition continues to exist after several start up attempts, boiler will switch into lock-out (fault) mode. The boiler can only start operating again once cause(s) of the lock-out have been rectified and after pressing button.

Lock-out Mode
A temporary lock-out caused by an unusual occurrence in the boiler’s operation. e.g. Display gives code of blocked flue (code St9). Boiler control will try to re-start several times. Boiler will start up again after blocking condition(s) have been eliminated.

Shutdown codes can be read out as follows:
- Press the two buttons simultaneously.
- Confirm by pressing button. "St" is displayed, alternating with the shutdown code "9".
- Press the (+) button. "Su" appears on the screen.

Boiler will start again automatically when reason for blocking has been removed.

</tbody>
</table>

(1) These lock-outs are not stored in fault memory  
(2) tFG : flue gas sensor
13.3 Error History

Boiler control is equipped with error memory which, records last 16 errors. In addition to storing error codes, the following data is also saved:

- Number of times that the error occurred: \((n:xx)\).
- Boiler operating mode selected \((St:xx)\).
- The supply temperature \((t1:xx)\) and the return temperature \((t2:xx)\) when the error occurred.

To view the error history, enter access code 0012.

13.4 Error History Readout

- Press two \(\bigtriangledown\) buttons simultaneously and then \((+\) button until the \(\Delta\) symbol flashes on the menu bar.
- Select the installers menu using \(\leftarrow\) button. "CODE" appears on the display.
- Use \((-\) or \((+\) button to input installer code 0012.
- Press \(\leftarrow\) button. "Er:xx" appears on the display.
- The fault list can be displayed by pressing \((-\) or \((+\) button.
- Confirm using \(\leftarrow\) button. "Er:xx" is displayed with "xx" flashing = Last error which occurred, for example "2".
- Use \((-\) or \((+\) buttons to scroll through faults.
- Press \(\leftarrow\) button to display details of faults or shutdowns.
- Press \((-\) or \((+\) buttons to view the following information:
  - \(n:1\) = Number of times that the error occurred.
  - \(hr\) = The number of operating hours.
  - \(St\) = State.
  - \(Su\) = Sub-status.
  - \(t1\) = Supply temperature °F/°C.
  - \(t2\) = Return temperature °F/°C. \(t3\) = DHW tank temperature °F/°C.
  - \(t4\) = Outdoor temperature °F/°C (Only with an outdoor temperature sensor).
  - \(t5\) = Solar panel temperature °F/°C. \(t6\) = Flue gas temperature °F/°C.
  - \(Sp\) = Internal set point °F/°C.
  - \(fl\) = Ionization current (μA).
  - \(nf\) = Fan speed in rpm.
  - \(Pr\) = Water pressure psi/bar.
  - \(Po\) = Supplied relative heat output (%).
- Press \(\bigtriangledown\) button to interrupt display cycle. "Er:xx" is displayed with "xx" flashing = Last error which occurred.
- Use \((-\) or \((+\) button to scroll through faults.
- Press \(\leftarrow\) button to show fault list.
- Press \(\bigtriangledown\) button 2 times to exit error history.
13 - TROUBLE SHOOTING

13.5 Optional Sensors

1. Outdoor Air Sensor, if used.
   A. Boiler automatically recognizes sensor when used.
   B. See Chart 1 for sensor data. Sensor part number BD710487302V
   C. Locate outdoor sensor to protect against wind and direct sunlight. Mounting instructions provided with sensor.
   D. Maximum wire length is 100 ft (30m) for 22 ga. wire, or 150 ft (45m) for 18 ga. wire.

2. Sensor for Indirect DHW Tank (Heating Only Boiler).
   A. See Chart 2 for sensor data.

13 - TROUBLE SHOOTING

Troubleshooting Chart 1

- E02 - Supply Sensor Short
- E03 - Supply Sensor Open
- E04 - Heat Exchanger Temp.
- E05 - Heat Exchanger Temp.
- E06 - Return Sensor Short
- E07 - Return Sensor Open
- E08 - Low Return Temp.
- E09 - High Return Temp.

Locate Appropriate Sensor
See Figure 1 (page) and Figure (Wire Diagram)

Trace wire leads. Are all connections tight and wires undamaged?

NO

Repair wire and/or fix connection.

YES

Check continuity across sensor. OK?

NO

Replace Sensor

YES

Check sensor element is properly installed in pipe.

NO

Re-Install Sensor Properly

YES

Check sensor resistance and compare to temperature resistance curve (Figure 13-1 page 88. (Remove sensor if needed). Ok?

NO

Replace Control Board

YES

Replace Sensor
Troubleshooting Chart 2

**E16 - False Flame Signal**

1. **Turn Off All Heat Calls**
2. Inspect Burner through sight glass. Is flame present?
   - **NO**
   - **YES**
     - **Replace Gas Valve**
     - **Replace Flame Sense**
     - **Adjust Gas Mixture See Section 9. Re-check. E-16 still present?**
       - **YES**
       - **Condition Corrected**
       - **Out of Range**
         - **Replace Flame Sense**
         - **In Range**
           - **Replace Flame Sense**

Initiate heat call. Check CO$_2$ at high fire is 9.1-9.5%
Troubleshooting Chart 3

**E12 - High Temperature**

- **Is High Limit Jumper Plug in Place?**
  - **YES**
  - **NO**

- **Is external High Limit Switch off?**
  - **YES**
  - **NO** or **N/A**

  - **Re-install plug**

  - **Reset Switch**

  - **Check Boiler Pump OK?**
    - **YES**
    - **NO**

    - **Replace Pump**
    - **Replace Heat Exchanger**

  - **Check switches 4 and 5 in wire diagram. Both electrical connected and continuity?**
    - **YES**
    - **NO**

    - **Does heat exchanger switch 6 (in wire diagram) have continuity?**
      - **YES**
      - **NO**

      - **Repair plug or replace switch**

  - **Water Circulation Adequate?**
    - **YES**
    - **NO**

    - **Purge air in system**
    - **Repair Piping**
13 - TROUBLE SHOOTING

Troubleshooting Chart 4

**E10, E11** - Temperature Difference Between Supply and Return Too Great

**E35** - Supply and Return Sensors Reversed

Is return line warmer than supply line?

- [ ] YES
- [ ] NO

Check water pressure. Is water pressure at least 15 psig?

- [ ] YES
- [ ] NO

Are any water valves partially closed?

- [ ] YES
- [ ] NO

Open all valves

Check wire harness against wiring diagram. Are Supply sensor wires green and Return Sensor wires red?

- [ ] YES
- [ ] NO

Check wire plugs are securely connected to sensors.

- [ ] YES
- [ ] NO

Check both sensors are properly inserted into pipe lines.

- [ ] YES
- [ ] NO

Refer to temperature sensor chart

- [ ] YES
- [ ] NO

Error Code is accurate. Correct system piping.

Onboard pump operation properly?

- [ ] YES
- [ ] NO

Possible air in system. De-aerate

Wire connections are reversed. Correct wiring connections.

Assure wire harness plugs are securely connected to sensors

Repair sensor insertion into pipe lines

Replace sensor

Replace control board

Replace pump
Troubleshooting Chart 5

E14 - Burner Start Up Failures

Is this a new boiler on first startup?
- **YES**
- **NO**

LP installation?
- **YES**
- **NO**

LP Conversion Kit installed?
- **NO**
- **YES**

Install Conversion Kit

Is the gas shutoff valve closed?
- **NO**
- **YES**

Open the gas shutoff valve

Check all wires including igniter and gas valve are connected and tight
- **YES**
- **NO**

Connect All Wires And Assure Secure Fit

Are ground wires attached and boiler properly grounded?
- **YES**
- **NO**

Provide Proper Ground

Has all air been purged from gas line?
- **NO**
- **YES**

Purge all air from gas line

Check gas inlet pressure at least equals rating plate requirements.
- **NO**
- **YES**

Press RESET for two (2) seconds and retry. Is there a strong, consistent spark?
- **NO**
- **YES**

Remove igniter and inspect. Is there contamination?
- **YES**
- **NO**

Clean Or Replace Igniter

Does the boiler ignite?
- **YES**
- **NO**

Restart the boiler and place into high fire.

Check venting for obstruction and or wind effects

Hold the igniter and retry ignition. Is there a spark?
- **YES**
- **NO**

Replace Spark Generator

Remove burner and inspect. Any sign of damage to burner surface?
- **NO**
- **YES**

Replace Burner

Check interior of heat exchanger for debris or other signs of blockage
- **YES**
- **NO**

Clean Heat Exchanger

Clean Heat Exchanger

Replace Gas Valve
**Troubleshooting Chart 7**

**E34 - Fan Fault**

Check all wires including blower valve are connected and tight

<table>
<thead>
<tr>
<th>YES</th>
<th>NO</th>
</tr>
</thead>
</table>

Check venting for obstruction (both inlet and exhaust)

<table>
<thead>
<tr>
<th>NO</th>
<th>YES</th>
</tr>
</thead>
</table>

- Replace Blower Assembly
- Clear Vent Obstruction

**Troubleshooting Chart 8**

**E39 - Shutdown Input In Locked Out Mode**

Check BL connection on control board terminal strip. Is this function being utilized?

<table>
<thead>
<tr>
<th>YES</th>
<th>NO</th>
</tr>
</thead>
</table>

- Are the wire connections secure?
- Is factory installed jumper securely in place?

<table>
<thead>
<tr>
<th>NO</th>
<th>YES</th>
<th>NO</th>
</tr>
</thead>
</table>

- Secure wire connections
- Check external accessories are correct
- Check external accessories are correct
- Install jumper securely in place

- Repair/Replace External Accessory Item As Required
- Replace Control Board
- Change Installation Parameters As Required
**Troubleshooting Chart 9**

**E40 - HRU/URC Unit test error**

Is HRU terminal being used on the auxiliary SCU board (see section 8)?

- **YES**
- **NO**

Is wiring connection to HRU terminal secure?

- **NO**
  - Fix Wiring Connection
  - Is Parameter P42 set to 1?
    - **NO**
      - Set P42 to 1
        - **OK**
          - Done
        - **Not OK**
          - **Not OK**
  - **YES**

Is wiring connection from SCU board to main board secure?

- **NO**
  - Fix Wiring Connection
  - Is P42 parameter set to 0?
    - **NO**
      - Replace SCU board
        - **Not OK**
          - NOT OK
        - **OK**
          - Done
    - **YES**
      - Replace Main Control Board
        - Done
  - **YES**

Is HRU accessory operating properly?

- **NO**
  - Correct HRU Accessory
- **YES**
  - Done

P/N 240011656, Rev. D [09/15/2017]
Troubleshooting Chart 10

**E42 - Low Water Pressure**

Check system water pressure with tridicator or other device. Is water pressure at least 15 psig?

- **YES**
  - Secure Wire Harness Connections
  - Is low water pressure sensor (item 12 in wiring diagram) securely installed to block?
    - **Yes**
      - Correct Installation
    - **NO**
      - Replace Sensor.

- **NO**
  - The error code is accurate. Correct water pressure and/or correct system leaks.

**Note:** This error code refers to the onboard low water pressure switch, not any field installed external low water cutoff device.
**E43 - No Water Temperature Difference During Operation**

Start Boiler. Is supply line warmer than return line?

- **YES**
- **NO**

**Onboard pump operating properly?**

- **YES**
- **NO**

Possible air in the system. De-aerate.

- **NOT OK**
- **OK**

Check both sensors are properly inserted into pipe lines.

- **NO**
- **YES**

Assure wire harness plugs are securely connected to sensors.

- **NO**
- **YES**

Check wire plugs are securely connected to temperature sensors.

Report Sensor Insertion Into Pipe Lines.

Refer to Temperature Sensor Chart (both sensors)

- **OK**
- **Not OK**

Replace Sensor

Replace Control Board

Replace Pump

Done

</tbody>
</table>
**APPLIANCE** - Device to convert gas into energy; term includes any component, control, wiring, piping or tubing required to be part of the device.

**ANSI** - American National Standards Institute, Inc. oversees creation and maintenance of voluntary consensus standards, including ANSI Z21.13/CSA 4.9: Gas-Fired Low Pressure Steam and Hot Water Boilers.

**ASTM** - American Society for Testing and Materials. ASTM International is one of largest voluntary standards development organizations in world trusted source for technical standards for materials, products, systems, and services. Known for their high technical quality and market relevancy, ASTM International standards have important role in information infrastructure that guides design, manufacturing and trade in the global economy.

**AUTHORITY HAVING JURISDICTION** - Individual or organization adopting and enforcing codes, rules, and by-laws governing various concerns of community. Commonly referred to as “final authority” for any matters relating to LIFE SAFETY and BUILDING CONSTRUCTION within a community.

**BOILER** - Appliance intended to supply hot liquid for space-heating, processing or power purposes.

**Btu** - Abbreviation for British Thermal Unit. Quantity of heat required to raise temperature of 1 pound of water 1°F.

**BURNER** - Device for final conveyance of gas or mixture of gas and air, to combustion zone.

**CALIBRATE** - Make fine adjustments or divide into marked intervals for optimal measuring.

**COMBUSTION** - Rapid oxidation of fuel gases accompanied by production of heat or heat and light. Complete combustion of fuel is possible only in presence of adequate supply of Oxygen.

**COMBUSTIBLE MATERIAL** - Materials made of or surfaced with wood, compressed paper, plant fibers, or other materials capable of being ignited and burned. Such material shall be considered combustible even though flame-proofed, fire-retardant treated, or plastered.

**COMBUSTION AIR** - Air that is drawn into an appliance to mix with fuel and support combustion.

**CONDENSATE** - Liquid separated from flue gas due to reduction in temperature.

**DIRECT VENT BOILER** - Boiler constructed and installed so all combustion air is derived directly from outdoors and all vent gases are discharged to outdoors.

**DOMESTIC** - Relating to household usage as opposed to commercial usage.

**DOMESTIC WATER** - Potable drinking water - tap water.

**DRAFT** - Pressure difference causes gases or air to flow through a chimney, vent, flue or appliance.

**FLA** - Full load amps.

**FLUE** - Enclosed passageway for conveying combustion gases.

**FLUE GASES** - Products of combustion plus excess air in appliance flues or heat exchanger.

**GAS SUPPLIER** - Party that sells commodity of Natural Gas (Gas A) or LPG (Gas E).

**HIGH-VOLTAGE** - Circuit involving potential of not more than 600 volts and having circuit characteristics in excess of those of low-voltage circuit.

**IGNITER** - Device utilizing electrical energy to ignite gas at main burner.

**LEAK CHECK** - Operation performed on gas piping system to verify system does not leak.

**LICENSED QUALIFIED INSTALLER / SERVICE TECHNICIAN** - any individual, firm, corporation or company that either directly or through a representative is engaged in the installation, replacement, repair or servicing of gas piping, venting systems, appliances, components, accessories, or equipment, and whose representative is experienced and trained, in such work and has complied with the requirements of the authority having jurisdiction.

**LOW WATER CUTOFF** - Device constructed to automatically cut off fuel supply when surface of water in boiler falls to lowest safe water level.

**LOW-VOLTAGE** - Circuit involving potential of not more than 30 volts.

**METRIC GAS METERS**

**Natural Gas**

\[
\text{MBH} = \frac{127,116 \times \text{cu meters}}{\text{Seconds}}
\]

For example: Gas Meter measures 0.1 cubic Meters in 100 seconds

\[
\text{MBH} = \frac{127,116 \times 0.1}{100} = 127 \text{ MBH}
\]

**Propane Gas (LP)**

\[
\text{MBH} = \frac{383,482 \times \text{cu meters}}{\text{Seconds}}
\]
• **PRESSURE TEST** - Operation performed to verify gas tight integrity of gas piping following its installation or modification.

• **PURGE** - To free gas conduit of air or gas, or mixture of gas and air.

• **PURGE TIME** - Period of time intended to allow for dissipation of any unburned gas or residual products of combustion.

• **QUALIFIED AGENCY** - Any individual, firm, corporation, or company engaged in and responsible for:
  - Installation, testing, or replacement of gas piping, or connection, installation, testing, repair or servicing of appliances and equipment.
  - Experienced in such work.
  - Familiar with all precautions required.
  - Complies with all requirements of authority having jurisdiction.

• **SAFETY RELIEF VALVE** - Valve designed to relieve pressure in hot water supply system when pressure exceeds pressure capability of equipment.

• **SAFETY SHUTOFF DEVICE** - Device that will shut off gas supply to controlled burner in event source of ignition fails.

• **SEDIMENT TRAP** - Gas piping arrangement designed to collect any liquid or solid contaminant before reaching gas valve.

• **SERVICE** - Supply, installation, or maintenance of goods carried out by a Qualified Installer / Service Technician.

• **TWO PIPE SYSTEM** - Type of venting that allows for exhaust flue and intake air piping to be separated from each other. Fresh air may be drawn in at a different area from where flue terminal is located.

• **VENT** - Passageway used to convey flue gases from appliance vent connector to outdoors.

• **VENTING SYSTEM** - Continuous open passageway from of appliance vent connector to outdoors for purpose of removing flue or vent gases.
IMPORTANT

In accordance with Section 325 (f) (3) of the Energy Policy and Conservation Act, this boiler is equipped with a feature that saves energy by reducing the boiler water temperature as the heating load decreases. This feature is equipped with an override which is provided primarily to permit the use of an external energy management system that serves the same function.

THIS OVERRIDE MUST NOT BE USED UNLESS AT LEAST ONE OF THE FOLLOWING CONDITIONS IS TRUE:

- An external energy management system is installed that reduces the boiler water temperature as the heating load decreases.
- This boiler is not used for any space heating
- This boiler is part of a modular or multiple boiler system having a total input of 300,000 BTU/hr or greater.
- This boiler is equipped with a tankless coil.
